Dear Senators BURTENSHAW, Adams, Semmelroth, and Representatives BARBIERI, Furniss, Chew:

The Legislative Services Office, Research and Legislation, has received the enclosed rules of the Department of Environmental Quality:

IDAPA 58.01.08 - Idaho Rules for Public Drinking Water Systems (ZBR Chapter Rewrite, Fee Rule) - Proposed Rule (Docket No. 58-0108-2301).

Pursuant to Section 67-454, Idaho Code, a meeting on the enclosed rules may be called by the cochairmen or by two (2) or more members of the subcommittee giving oral or written notice to Research and Legislation no later than fourteen (14) days after receipt of the rules' analysis from Legislative Services. The final date to call a meeting on the enclosed rules is no later than 11/20/2023. If a meeting is called, the subcommittee must hold the meeting within forty-two (42) days of receipt of the rules' analysis from Legislative Services. The final date to hold a meeting on the enclosed rules is 12/18/2023.

The germane joint subcommittee may request a statement of economic impact with respect to a proposed rule by notifying Research and Legislation. There is no time limit on requesting this statement, and it may be requested whether or not a meeting on the proposed rule is called or after a meeting has been held.

To notify Research and Legislation, call 334-4854, or send a written request to the address on the memorandum attached below

Legislative Services Office Idaho State Legislature

Serving Idaho's Citizen Legislature

MEMORANDUM

TO: Rules Review Subcommittee of the Senate Resources & Environment Committee and the

House Environment, Energy & Technology Committee

Deputy Division Manager - Katharine Gerrity FROM:

DATE: November 01, 2023

SUBJECT: Department of Environmental Quality

IDAPA 58.01.08 - Idaho Rules for Public Drinking Water Systems (ZBR Chapter Rewrite, Fee Rule) -Proposed Rule (Docket No. 58-0108-2301)

Summary and Stated Reasons for the Rule

The Department of Environmental Quality submits notice of proposed rule at IDAPA 58.01.08 - Idaho Rules for Public Drinking Water Systems. According to the department, the rulemaking was initiated in compliance with Executive Order No. 2020-01, Zero-Based Regulation. The department states that the goal of the rulemaking is to perform a critical and comprehensive review of the entire chapter in an attempt to reduce overall regulatory burden, streamline various provisions, increase clarity and ease of use, and maintain state program approval. The department notes that the rulemaking also updates federal regulations incorporated by reference with the July 1, 2023 Code of Federal Regulations (CFR) effective date and that adoption of federal regulations is necessary to maintain program primacy. The department further states that incorporation by reference allows DEO to keep its rules up to date with federal regulations and simplifies compliance for the regulated community.

In compliance with Section 39-107D, Idaho Code, the department indicates that the engineering standards for design, construction, and operation of public drinking water systems regulate activities that are not regulated by the federal government. The department goes on to provide as follows: The standards were originally promulgated to fulfill the requirements of Section 39-118, Idaho Code, and pre-date the Safe Drinking Water Act. These proposed rules address the review and approval of plans and specifications for public drinking water systems and the standard by which the agency does the review and approval. This is not an activity regulated by the federal government. This is an activity, however, that DEQ has regulated for years pursuant to Section 39-118, Idaho Code, and 58.01.08, Idaho Rules for Public Drinking Water Systems. To the extent DEQ is not proposing any new regulation of activities, Section 39-107D, Idaho Code, is most likely not applicable.

The department states that this is a fee rule but the rulemaking does not impose or increase a fee beyond what was previously submitted to and reviewed by the Idaho Legislature in prior rules and that fees included in this rule chapter are authorized by Section 39-119, Idaho Code.

Negotiated Rulemaking / Fiscal Impact

The department indicates that negotiated rulemaking was conducted and that there will be no fiscal impact to the general fund as a result of the rule.

Statutory Authority

The rulemaking appears to be authorized by Chapter 21, Title 37, and Chapter 1, Title 39, Idaho Code.

cc: Department of Environmental Quality Caroline Moores

*** PLEASE NOTE ***

Per the Idaho Constitution, all administrative rules may be reviewed by the Legislature during the next legislative session. The Legislature has 3 options with this rulemaking docket: 1) Approve the docket in its entirety; 2) Reject the docket in its entirety; or 3) Reject the docket in part.

IDAPA 58 – DEPARTMENT OF ENVIRONMENTAL QUALITY 58.01.08 – IDAHO RULES FOR PUBLIC DRINKING WATER SYSTEMS DOCKET NO. 58-0108-2301 (ZBR CHAPTER REWRITE, FEE RULE) NOTICE OF RULEMAKING – PROPOSED RULE

AUTHORITY: In compliance with Section 67-5221(1), Idaho Code, notice is hereby given that this agency has initiated proposed rulemaking. This action is authorized by Chapter 1, Title 39, Idaho Code.

PUBLIC HEARING SCHEDULE: No hearings have been scheduled. Pursuant to Section 67-5222(2), Idaho Code, a public hearing will be held if requested in writing by twenty-five (25) persons, a political subdivision, or an agency. Written requests for a hearing must be received by the undersigned on or before September 22, 2023. If no such written request is received, a public hearing will not be held. Two public meetings were held during the negotiated rulemaking process.

DESCRIPTIVE SUMMARY: DEQ initiated this rulemaking in compliance with Executive Order No. 2020-01, Zero-Based Regulation (EO 2020-01), issued by Governor Little on January 16, 2020. Pursuant to EO 2020-01, each rule chapter effective on June 30, 2020, shall be reviewed by the agency that promulgated the rule. The review will be conducted according to a schedule established by the Division of Financial Management, Office of the Governor (DFM), posted at https://adminrules.idaho.gov/forms_menu.html. This is one of the DEQ rule chapters up for review in 2023. The goal of the rulemaking is to perform a critical and comprehensive review of the entire chapter in an attempt to reduce overall regulatory burden, streamline various provisions, increase clarity and ease of use, and maintain state program approval.

This rulemaking also updates federal regulations incorporated by reference with the July 1, 2023 Code of Federal Regulations (CFR) effective date. The July 1, 2023 CFR is a codification of federal regulations published in the Federal Register as of July 1, 2023. Adoption of federal regulations is necessary to maintain program primacy. Incorporation by reference allows DEQ to keep its rules up to date with federal regulations and simplifies compliance for the regulated community.

Citizens of the state of Idaho, environmental groups, DEQ's Drinking Water Advisory Committee, the Idaho Water Utility Council, the Association of Civil Engineers, the Idaho Chapters of the American Water Works Association, and owners and operators of drinking water treatment facilities may be interested in commenting on this proposed rule. The rule is expected to be final and effective upon the conclusion of the 2024 legislative session if adopted by the Board and approved by the Idaho Legislature.

FEE SUMMARY: This rulemaking does not impose or increase a fee beyond what was previously submitted to and reviewed by the Idaho Legislature in prior rules. Fees included in this rule chapter are authorized by Section 39-119, Idaho Code.

FISCAL IMPACT: The following is a specific description, if applicable, of any negative fiscal impact on the state general fund greater than ten thousand dollars (\$10,000) during the fiscal year resulting from this rulemaking: Not applicable.

NEGOTIATED RULEMAKING: On March 1, 2023, the notice of negotiated rulemaking was published in the Idaho Administrative Bulletin and on March 30, 2023, a preliminary draft rule was posted on DEQ's website. Meetings were held on April 11 and May 9, 2023. Stakeholders and members of the public participated by receiving email notifications, attending the meetings, reviewing DEQ's presentations, and submitting comments. Key information was posted on DEQ's website and distributed to persons who participated in the negotiated rulemaking.

All comments received during the negotiated rulemaking process were considered by DEQ when making decisions regarding the development of the rule. At the conclusion of the negotiated rulemaking process, DEQ submitted the draft rule to the Division of Financial Management for review. DEQ formatted the draft for publication as a proposed rule and is now seeking public comment. The negotiated rulemaking record, which includes the negotiated rule drafts, documents distributed during the negotiated rulemaking process, and the negotiated rulemaking summary, is available at https://www.deq.idaho.gov/drinking-water-docket-no-58-0108-2301/.

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

INCORPORATION BY REFERENCE: Pursuant to Section 67-5229(2)(a), Idaho Code, the following is a brief synopsis of why the materials cited are being incorporated by reference into this rule:

Adoption of federal regulations is necessary to maintain program primacy, allows DEQ to keep its rules up to date with federal regulation changes, and simplifies compliance for the regulated community. Information for obtaining a copy of the federal regulations is included in the rule.

In compliance with Idaho Code 67-5223(4), DEQ prepared a brief synopsis detailing the substantive differences between the previously incorporated material and the latest revised edition or version of the incorporated material being proposed for incorporation by reference. The Overview of Incorporations by Reference is available at https://www.deq.idaho.gov/drinking-water-docket-no-58-0108-2301/.

IDAHO CODE SECTION 39-107D STATEMENT: Section 39-107D, Idaho Code applies to a rule which "proposes to regulate an activity not regulated by the federal government." The engineering standards for design, construction, and operation of public drinking water systems regulate activities that are not regulated by the federal government. These standards were originally promulgated to fulfill the requirements of Section 39-118, Idaho Code, and pre-date the Safe Drinking Water Act. These proposed rules address the review and approval of plans and specifications for public drinking water systems and the standard by which the agency does the review and approval. This is not an activity regulated by the federal government. This is an activity, however, that DEQ has regulated for years pursuant to Section 39-118, Idaho Code, and 58.01.08, Idaho Rules for Public Drinking Water Systems. To the extent DEQ is not proposing any new regulation of activities, Section 39-107D, Idaho Code, is most likely not applicable.

Assuming Section 39-107D, Idaho Code, is applicable, 39-107D(3) provides that any rule subject to 39-107D that proposes a standard necessary to protect human health and the environment must also include in the rulemaking record and in the notice of rulemaking additional information. This additional information includes any estimates of risk accomplished, identification of populations or receptors addressed by any estimates, and other information related to an estimation of risk. The proposed rules include facility standards which are intended to protect human health and the environment. The standards, however, are for the design and construction of public drinking water facilities. For example, the rules require that water mains be constructed using materials that meet national standards for potable water. The rules are not based upon any express estimate or analysis of risk to public health or the environment. The facility standards are based upon guidelines set forth in documents, such as the "Recommended Standards for Water Works" and the "American Water Works Association Standards," that are generally accepted and used throughout the United States by engineers and state regulators, and which are all referenced in the rules.

ASSISTANCE ON TECHNICAL QUESTIONS: For assistance on questions concerning this proposed rulemaking, contact Tyler Fortunati at tyler.fortunati@deq.idaho.gov or (208) 373-0410.

SUBMISSION OF WRITTEN COMMENTS: Anyone may submit written comments regarding this proposed rule. The Department will consider all written comments received on or before October 6, 2023. Submit written comments to:

THE FOLLOWING IS THE PROPOSED TEXT OF FEE DOCKET NO. 58-0108-2301 (ZBR Chapter Rewrite)

58.01.08 - IDAHO RULES FOR PUBLIC DRINKING WATER SYSTEMS

000. LEGAL AUTHORITY.

The Idaho Legislature has given the Idaho Board of Environmental Quality the authority to promulgate rules governing quality and safety of drinking water, pursuant to Title 37, Chapter 21 and Title 39, Chapter 1, Title 39, Idaho Code.

001. TITLE AND SCOPE.

- **Title.** These rules are titled IDAPA 58.01.08, "Idaho Rules for Public Drinking Water Systems."
 (3.24.22)
- **Scope.** 40 CFR 141.3 is incorporated by reference. The purpose of these rules is to control and regulate the design, construction, operation, maintenance, and quality control of public drinking water systems to provide a degree of assurance that such systems are protected from contamination and maintained free from contaminants which may injure the health of the consumer.

 (3-24-22)(_____)

002. INCORPORATION BY REFERENCE AND AVAILABILITY OF REFERENCED MATERIALS.

- 01. Incorporation by Reference. The following documents are incorporated by reference into these rules.
- a. 40 CFR Part 141, revised as of July 1, 2015 2023 (excluding annual monitoring provisions in 40 CFR 141.854(a)(4),(d),(e),(f) and (h), and the Aircraft Drinking Water Rule in Subsection Subpart X); and 40 CFR Part 143, revised as of July 1, 2011 2023. Any reference in these rules to requirements, procedures, or specific forms contained in any section or subsection of 40 CFR Parts 141 and 143 shall constitute the full adoption by reference of that section or subsection, including any notes and appendices therein, unless expressly provided otherwise in these rules.
- **b.** American Water Works Association (AWWA) Standards, effective December-2009 2022, available for a fee from the AWWA, 66666 West Quincy Avenue, Denver, Colorado 80235, Telephone (800) 926-7337, http://apps.awwa.org/ebusmain/OnlineStore.aspx https://www.awwa.org/Publications/Standards/Standards-List or available to be viewed through the Department's state office.
- **O2. Availability of Specific Referenced Material**. Copies of specific documents referenced within these rules are available at the following locations:
- All federal regulations: Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, Telephone (202)783-3238; U.S. Government Bookstore, Room 194, Federal Bldg., 915 Second Ave., Seattle, WA 98174, (206) 553-4270; or Online at http://www.gpoaccess.gov/ccfr/index.html. (3-24-22)
- **b.** All documents incorporated by reference are available for review at the Department of Environmental Quality, 1410 N. Hilton, Boise, ID 83706-1255, (208) 373-0502. (3-24-22)

- db. Manual of Individual and Non-Public Water Supply Systems (EPA 570/9-91-004), published by the U.S. Environmental Protection Agency, available from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C.20402, Telephone (202) 782-3238 https://nepis.epa.gov.
- e. U.S. Department of Commerce, National Bureau of Standards Handbook, No. 69, "Maximum Permissible Concentrations of Radionuclides in Air and in Water for Occupational Exposure" as amended in 1963, NCRP Publications, P.O. Box 20175, Washington, D.C. 20014.
- **f.** Rules of the Idaho Water Resources Board are available at http://www.adminrules.idaho.gov/rules/37/37index.htm, or the Idaho Department of Water Resources, Idaho Water Center, 322 E. Front St., P.O. Box 83720, Boise, Idaho 83720-0098, Telephone (208) 287-4800. (3-24-22)

003. **DEFINITIONS.**

The definitions set forth in 40 CFR 141.2 are herein incorporated by reference, except for the definition of the terms "action level," "disinfection," "noncommunity water system," and "person." The terms "board," "director," "department," and "person" have the meaning provided in Section 39-103, Idaho Code. The term "watersheds" has the meaning provided in Section 39-3602, Idaho Code. The terms "distribution system," "license," "responsible charge," and "responsible charge operator" have the meaning provided in Section 54-2403, Idaho Code. The term "public utility" has the meaning provided in Section 61-129, Idaho Code. The term "pesticide" has the meaning provided in Section 22-3401, Idaho Code.

- **91.** Action Level. The concentration of lead or copper in water that determines, in some cases, whether a water system must install corrosion control treatment, monitor source water, replace lead service lines, or undertake a public education program. (3 24 22)
 - **O2.** Administrator. The Administrator of the United States Environmental Protection Agency.
 - 03. Annual Samples. Samples that are required once per calendar year. (3-24-22)
- **O4.** Annular Opening. As used in well construction, this term refers to the nominal inside diameter of the borehole minus the outside diameter of the casing divided by two (2).

 (3-24-22)
 - **051.** Aquifer. A geological formation of permeable saturated material, such as rock, sand, gravel, etc.,

DEPARTMENT OF ENVIRONMENTAL QUALITY Docket No. 58-0108-2301 Idaho Rules for Public Drinking Water Systems Proposed (Fee) Rulemaking capable of yielding an economic quantity of water to wells and springs. Average Day Demand. The volume of water used by a system on an average day based on a one See also the definition of Water Demand in these rules. **Backflow.** The reverse from normal flow direction in a plumbing system or water system caused by back pressure or back siphonage. Bag Filters. Pressure-driven separation devices that remove particulate matter larger than one (1) micrometer using an engineered porous filtration media. They are typically constructed of a non-rigid, fabric filtration media housed in a pressure vessel in which the direction of flow is from the inside of the bag to the outside. Bank Filtration. A water treatment process that uses a well to recover surface water that has naturally infiltrated into ground water through a river bed or bank(s). Infiltration is typically enhanced by the hydraulic gradient imposed by a nearby pumping water supply or other well(s). 10. Board. The Idaho Board of Environmental Quality. Capacity. The capabilities required of a public drinking water system (PWS) in order to achieve 1103. and maintain compliance with these rules and the requirements of the federal Safe Drinking Water Act (SDWA). It is divided into three (3) main elements: Technical capacity means the system PWS has the physical infrastructure to consistently meet drinking water quality standards and treatment requirements and is able to meet the requirements of routine and emergency operations. It further means the ability of system PWS personnel to adequately operate and maintain the

Financial capacity means the financial resources of the water system PWS, including an appropriate budget; rate structure; cash reserves sufficient for current operation and maintenance, future needs and emergency situations; and adequate fiscal controls. (3 24 22)(

system PWS and to otherwise implement technical knowledge. Training of operator(s) is required, as appropriate, for

с.	Managerial capacity means that the management structure o	of the water system PWS embodies	th
	system operations, including, but not limited to;	(3 24 22) (

- i. Short and long range planning; ii. Personnel management; iii. Fiduciary responsibility; iv. Emergency response; Customer responsiveness; v. vi. Source water protection; Administrative functions such as billing and consumer awareness; and vii. viii. Ability to meet the intent of the federal Safe Drinking Water Act SDWA.
- Cartridge Filters. Pressure driven separation devices that remove particulate matter larger than one (1) micrometer using an engineered porous filtration media. They are typically constructed as rigid or semi-rigid, self-supporting filter elements housed in pressure vessels in which flow is from the outside of the cartridge to the inside. $\frac{(3.24.22)}{}$

the system size and complexity.

(3-24-22)

- 13. Clean Compliance History. For the purposes of the Revised Total Coliform Rule in Subsection 100.01, clean compliance history means a record of no maximum contaminant level violations under Subsection 050.05, no monitoring violations under Subsection 100.01, and no coliform treatment technique trigger exceedances or treatment technique violations under Subsection 100.01.

 (3-24-22)
- 14. Combined Distribution System. The interconnected distribution system consisting of the distribution systems of wholesale systems and of the consecutive systems that receive finished water. (3-24-22)
- 15. Community Water System. A public water system which serves at least fifteen (15) service connections used by year round residents or regularly serves at least twenty five (25) year-round residents. See also the definition of a Public Drinking Water System in these rules.

 (3 24 22)
- **1604. Components of Finished Water Storage**. Storage is available to serve the system if the storage structure or facility is elevated sufficiently or is equipped with sufficient booster pumping capability to pressurize the system. Components of finished water storage are further defined as:
- **b.** Effective Storage. Effective storage is all storage other than dead storage and is made up of the additive components described in Paragraphs c. through f. of this Subsection.
- **c.** Operational Storage Storage supplies water when, under normal conditions, the sources are off. This component is the larger of; (3-24-22)(_____)
- i. The volume required to prevent excess pump cycling and ensure that the following volume components are full and ready for use when needed; or
 - ii. The volume needed to compensate for the sensitivity of the water level sensors. ()
- **d.** Equalization Storage-<u>is</u> <u>Ss</u>torage of finished water in sufficient quantity to compensate for the difference between a water system's maximum pumping capacity and peak hour demand.
 - e. Fire Suppression Storage: is \pm the water needed to support fire flow in those systems that provide it. $\frac{(3.24.22)}{(3.24.22)}$
- **f.** Standby Storage. Standby storage provides a measure of reliability or safety factor should if sources fail or when unusual conditions impose higher than anticipated demands. Normally used for emergency operation, if standby power is not provided, to provide water for eight (8) hours of operation at average day demand.

(3.24.22)(

- **1705. Composite Correction Program (CCP)**. A systematic approach to identifying opportunities for improving the performance of water treatment and implementing changes that will capitalize on these opportunities. The CCP consists of two (2) elements:
- a. Comprehensive Performance Evaluation (CPE). A thorough review and analysis of a treatment plant's performance based capabilities and associated administrative, operation, and maintenance practices. It is conducted to identify factors that may be adversely impacting a plant's capability to achieve compliance and emphasizes approaches that can be implemented without significant capital improvements. The CPE must consist of at least the following components: assessment of plant performance; evaluation of major unit processes; identification and prioritization of performance limiting factors; assessment of the applicability of comprehensive technical assistance; and preparation of a CPE report As defined in 40 CFR 141.2.
- **b.** Comprehensive Technical Assistance (CTA), is The implementation phase that is carried out if the CPE results indicate improved performance potential. During the CTA phase, the system PWS must identify and systematically address plant-specific factors. The CTA consists of follow-up to the CPE results, implementation of process control priority setting techniques, and maintaining long term involvement to systematically train staff and

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

administrators. (3-24-22)(

- 18. Compositing of Samples. The mixing of up to five (5) samples by the laboratory. (3-24-22)
- **1906. Confining Layer.** A nearly impermeable subsurface stratum which is located adjacent to one (1) or more aquifers and does not yield a significant quantity of water to a well.
- 20. Confirmation Sample. A sample of water taken from the same point in the system as the original sample and at a time as soon as possible after the original sample was taken.

 (3-24-22)
- 21. Connection. Each structure, facility, or premises which is connected to a water system, and which is or could be used for domestic purposes, is considered a single connection. A single family residence is considered to be a premises. Multi-family dwellings and apartment, condominium, and office complexes are considered single connections unless individual units are billed separately for water by the water system, in which case each such unit shall be considered a single connection.

 (3-24-22)
- 22. Consecutive System. A public water system that receives some or all of its finished water from one (1) or more wholesale systems. Delivery may be through a direct connection or through the distribution system of one (1) or more consecutive systems. (3-24-22)
 - 2307. Consumer. Any person served by a public water system PWS. (3-24-22)(
- **2408. Consumer Confidence Report** (**CCR**). An annual report that community water systems must deliver to their customers. The reports must contain information on the quality of the water delivered by the <u>systems PWS</u> and characterize the risks (if any) from exposure to contaminants detected in the drinking water in an accurate and understandable manner.
 - 25. Contaminant. Any physical, chemical, biological, or radiological substance or matter in water.

 (3.24.22)
- 2609. Cross Connection. Any actual or potential connection or piping arrangement between a public or a consumer's potable water system and any other source or system through which it is possible to introduce into any part of the potable water system used water, water from any source other than an approved public water system, industrial fluid, gas or substance other than the intended potable water with which the system is supplied. Cross connections include bypass arrangements, jumper connections, removable sections, swivel or change over devices and other temporary or permanent devices which, or because of which "backflow" can or may occurAn actual or potential connection or piping arrangement between a drinking water system and another source that could introduce contamination into the potable water system through backflow, backsiphoning, or backpressure.

 (3 24 22)()
- **2710. Dead End Main**. A distribution main of any diameter and length that does not loop back into the distribution system.
- 28. Dead Storage Storage that is either not available for use in the system or can provide only substandard flows and pressures. See also the definition of Components of Finished Water Storage in these rules.
 - 29. Department. The Idaho Department of Environmental Quality. (3-24-22)
 - 30. Director. The Director of the Department of Environmental Quality or his designee. (3-24-22)
- **3111. Direct Integrity Test (DIT)**. A physical test applied to a microfiltration or ultrafiltration membrane unit in order to identify integrity breaches.
- **32. Disinfection.** Introduction of chlorine, other agents, or processes that are approved by the Department (such as ultraviolet light) in sufficient concentration, dosage, or application, and for the time required to kill or inactivate pathogenic and indicator organisms.

 (3 24 22)

- 33. Disinfection Profile. A summary of daily Giardia lamblia inactivation through the drinking water treatment plant. The procedure for developing a disinfection profile is contained in 40 CFR 141.172 and 40 CFR 141.530-141.536.
- 34. Distribution System. Any combination of pipes, tanks, pumps, and other equipment which delivers water from the source(s), treatment facility(ies), or a combination of source(s) and treatment facility(ies) to the consumer. Chlorination may be considered as a function of a distribution system.

 (3-24-22)
 - 35. Drinking Water. Means "water for human consumption." (3-24-
- **3612. Drinking Water System**. All mains, pipes, and structures through which water is obtained and distributed, including wells and well structures, intakes and cribs, pumping stations, treatment plants, reservoirs, storage tanks and appurtenances, collectively or severally, actually used or intended for use for the purpose of furnishing water for drinking or general domestic use.
- 37. Dual Sample Set. A set of two (2) samples collected at the same time and same location, with one (1) sample analyzed for TTHM and the other sample analyzed for HAA5. Dual sample sets are collected for the purposes of conducting an Initial Distribution System Evaluation (40 CFR Part 141, Subpart U) and for determining compliance with the TTHM and HAA5 MCLs under the Stage 2 Disinfection Byproducts Requirements (40 CFR Part 141, Subpart V).
- **3813. Effective Contact Time.** For the purpose of these rules, effective contact time means the time in minutes that it takes for water to move from the point of completely mixed chemical application to the point where residual concentration is measured. It is the "T" in contact time (CT) calculations and is either "demonstrated" or "calculated." It is the contact time sufficient to achieve the inactivation of target pathogens under the expected range of raw water pH and temperature variation and must be demonstrated through tracer studies or other evaluations or calculations acceptable to the Department. "Improving Clearwell Design for CT Compliance," referenced in Subsection 002.02, contains information that may be used as guidance for these calculations.
- 39. Effective Storage. Effective storage is all storage other than dead storage and is made up of the additive components described in Paragraphs e. through f. of the definition of Components of Finished Water Storage in these rules.

 (3 24 22)
- **40.** Enhanced Coagulation. The addition of sufficient coagulant for improved removal of disinfection byproduct precursors by conventional filtration treatment. Conventional filtration treatment is defined in 40 CFR 141.2. (3-24-22)
- 41. Enhanced Softening. The improved removal of disinfection byproduct precursors by precipitative softening. (3-24-22)
- 42. Equalization Storage of finished water in sufficient quantity to compensate for the difference between a water system's maximum pumping capacity and peak hour demand. See also the definition of Components of Finished Water Storage in these rules.

 (3-24-22)
- **4314. Equivalent Dwelling Unit (EDU)**. A unit of measure that standardizes all land use types (housing, retail, office, etc.) to the level of demand created by a single-family detached housing unit within a water system. The demand for one (1) equivalent dwelling unit is equivalent to the amount of water provided to the average single-family detached housing unit within a water system. For example, a business designed to use three (3) times as much water as an average single-family detached housing unit—would will have a demand of three (3) equivalent dwelling units.
- **4415. Exemption**. A temporary deferment of compliance with a maximum contaminant level or treatment technique requirement which may be granted only if the <u>system PWS</u> demonstrates to the satisfaction of the Department that the <u>system PWS</u> cannot comply due to compelling factors and the deferment does not cause an unreasonable risk to public health.
 - 4516. Facility Plan. The facility plan for a public drinking water system PWS describes the overall

system, including sources of water, treatment processes and facilities, pumping stations and distribution piping, finished water storage, and waste disposal. It is a comprehensive planning document for infrastructure and includes a plan for the future of the system/facility, including upgrades and additions. It is usually updated on a regular basis due to anticipated or unanticipated growth patterns, regulatory requirements, or other infrastructure needs. A facility plan is sometimes referred to as a master plan or facilities planning study. In general, a facility plan is an overall systemwide plan as opposed to a project specific plan.

(3-24-22)(_____)

- 46. Facility Standards and Design Standards. Facility standards and design standards are described in Sections 500 through 552 of these rules. Facility and design standards found in Sections 500 through 552 of these rules must be followed in the planning, design, construction, and review of public drinking water facilities. (3-24-22)
- 47. Fee Assessment. A charge assessed on public drinking water systems based on a rate structure ealeulated by system size.
- 48. Filter Profile. A graphical representation of individual filter performance, based on continuous turbidity measurements or total particle counts versus time for an entire filter run, from startup to backwash inclusively, that includes an assessment of filter performance while another filter is being backwashed. (3 24 22)
- **4917. Filtrate**. As the term relates to microfiltration and ultrafiltration, the product water or the portion of the feed stream that has passed through the membrane.
- **50. Finished Water.** Water that is introduced into the distribution system of a public water system and is intended for distribution and consumption without further treatment, except as necessary to maintain water quality in the distribution system (e.g., booster disinfection, addition of corrosion control chemicals). (3-24-22)
- **5118. Finished Water Storage Structures or Facilities.** Finished water storage structures or facilities are defined as:
- a. Above-ground storage structure or facility-<u>is</u> \underline{Aa} finished water storage structure or facility with a bottom elevation above normal ground surface. (3-24-22)(
- **b.** Ground-level storage structure or facility-<u>is</u> A<u>a</u> finished water storage structure or facility with a bottom elevation at normal ground surface. (3-24-22)(____)
- c. Partially buried storage structure or facility-<u>is</u> A<u>a</u> finished water storage structure or facility with a bottom elevation below normal ground surface and any portion of the structure or facility above normal ground surface.
- **d.** Below-ground storage structure or facility: <u>is</u> Aa finished water storage structure or facility with a bottom elevation and top elevation below normal ground surface. (3-24-22)(_____)
- **5219. Fire Flow Capacity**. The water system capacity, in addition to maximum day demand, that is available for fire fighting purposes within the water system or distribution system pressure zone. Adequacy of the water system fire flow capacity is determined by the local fire authority or through a hydraulic analysis performed by a licensed professional engineer to establish required fire flows in accordance with the International Fire Code as adopted by the State Fire Marshal.
- **5320. Fire Suppression Storage**. The water needed to support fire flow in those systems that provide it. See also the definition of Components of Finished Water Storage in these rules.
- **5421. Fixture Protection**. The practice of installing backflow prevention assemblies or devices to isolate one (1) or more cross connections within a customer's facility.
- **55. Flowing Stream.** As used in the Long Term 2 Enhanced Surface Water Treatment Rule (40 CFR Part 141, Subpart W), this term means a course of running water flowing in a definite channel. (3-24-22)
 - **5622.** Flux. The throughput of a pressure-driven membrane filtration process expressed as flow per unit

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

of membrane area, usually in gallons per square foot per day or liters per hour per square meter. ()

- 57. Ground Water System. A public water system which is supplied exclusively by a ground water source or sources.

 (3-24-22)
- 58. Ground Water Under the Direct Influence of Surface Water (GWUDI). Any water beneath the surface of the ground with significant occurrence of insects or other macroorganisms, algae, or large diameter pathogens such as Giardia lamblia or Cryptosporidium, or significant and relatively rapid shifts in water characteristics such as turbidity, temperature, conductivity, or pH which closely correlate to climatological or surface water conditions. Direct influence shall be determined by the Department for individual sources. The determination of direct influence may be based on site specific measurements of water quality, documentation of well construction characteristics and geology with field evaluation, a combination of water quality and documentation, or other information required by the Department.

 (3-24-22)
- **59.** Haloacetic Acids (Five) (HAA5). The sum of the concentrations in milligrams per liter of the haloacetic acid compounds (monochloroacetic acid, dichloroacetic acid, trichloroacetic acid, monobromoacetic acid, and dibromoacetic acid) rounded to two (2) significant figures after addition. (3 24 22)
- 6923. Health Hazards. Any condition, operation, or practice in a PWS which creates, or may has the potential to create, an acute or immediate danger to the consumer's health. Health hazards may consist of, but are not limited to, design, construction, operational, structural, collection, storage, distribution, monitoring, treatment or water quality elements of a public water system. See also the definition of Significant Deficiency, which refers to a health hazard identified during a sanitary survey.

 (3 24 22)(_____)
- **6124. Indirect Integrity Monitoring**. Monitoring some aspect of filtrate water quality that is indicative of the removal of particulate matter.
 - **6225. Inorganic**. Generally refers to compounds that do not contain carbon and hydrogen. ()
- **6326. Internal or In-Plant Isolation**. The practice of installing backflow prevention assemblies to protect an area within a water customer's structure, facility, or premises from contaminating another part of the structure, facility, or premises.
- **64.** Lake/Reservoir. As used in the Long Term 2 Enhanced Surface Water Treatment Rule (40 CFR Part 141, Subpart W), this term means a natural or man made basin or hollow on the Earth's surface in which water collects or is stored that may or may not have a current or single direction of flow. (3-24-22)
- 65. Level 1 Assessment. A Level 1 Assessment is an evaluation to identify the possible presence of sanitary defects, defects in distribution system coliform monitoring practices, and (when possible) the likely reason that the system triggered the assessment. It is conducted by the system operator or owner. Minimum elements include review and identification of atypical events that could affect distributed water quality or indicate that distributed water quality was impaired; changes in distribution system maintenance and operation that could affect distributed water quality (including water storage); source and treatment considerations that bear on distributed water quality, where appropriate (e.g., whether a ground water system is disinfected); existing water quality monitoring data; and inadequacies in sample sites, sampling protocol, and sample processing. The system must conduct the assessment consistent with any Department directives that tailor specific assessment elements with respect to the size and type of the system and the size, type, and characteristics of the distribution system.
- **66.** Level 2 Assessment. A Level 2 Assessment is an evaluation to identify the possible presence of sanitary defects, defects in distribution system coliform monitoring practices, and (when possible) the likely reason that the system triggered the assessment. A Level 2 assessment provides a more detailed examination of the system (including the system's monitoring and operational practices) than does a Level 1 assessment through the use of more comprehensive investigation and review of available information, additional internal and external resources, and other relevant practices. It is conducted by an individual approved by the Department in accordance with Subsection 305.03, which may include the system operator. Minimum elements include review and identification of atypical events that could affect distributed water quality or indicate that distributed water quality was impaired; changes in distribution system maintenance and operation that could affect distributed water quality (including water storage);

source and treatment considerations that bear on distributed water quality, where appropriate (e.g., whether a ground water system is disinfected); existing water quality monitoring data; and inadequacies in sample sites, sampling protocol, and sample processing.

(3-24-22)

- **67. License.** A physical document issued by the Idaho Division of Occupational and Professional Licenses certifying that an individual has met the appropriate qualifications and has been granted the authority to practice in Idaho under the provisions of Chapter 24, Title 54, Idaho Code. (3-24-22)
- **68.** Locational Running Annual Average (LRAA). The average of sample analytical results for samples taken at a particular monitoring location during the previous four (4) calendar quarters, as set forth in the Stage 2 Disinfection Byproducts Requirements (40 CFR Part 141, Subpart V). (3 24 22)
- **6927. Log.** Logarithm to the base ten (10). In the context of these rules, it is used in the determination of removal or inactivation efficiencies. It is expressed as the logarithm to the base ten (10) or "log" of the concentration of the feed or raw water minus the log of the concentration in the filtrate or product water. For example, if the incoming feed or raw water concentration is one hundred (100), and the outgoing filtrate or product water concentration is ten (10), a 10-fold reduction was attained; or 1-log removal. 1-log removal also equates to ninety percent (90%) removal, as ninety (90) of the original feed concentration counts had been removed, leaving ten (10) in the filtrate. Similarly, 2-log equates to ninety-nine percent (99%) removal.
- 7028. Log Removal Value (LRV). LRV is a measure of filtration removal efficiency for a target organism, particulate, or surrogate expressed as Logarithm to the base ten (10).
- 7129. Material Deviation. A change from the design plans that significantly alters the type or location of facilities, requires engineering judgment to design, or impacts the public safety or welfare system components

 (3 24 22)
- 7230. Material Modification. Those mModifications of an existing public water system PWS that are intended to increase system capacity or alter the methods or processes employed. Any project that adds source water to a system, increases the pumping capacity of a system, increases the potential population served by the system or the number of service connections within the system, adds new or alters existing drinking water system components, or affects the water demand of the system is considered to be increasing system capacity or altering the methods or processes employed. Maintenance and repair performed on the system and the replacement of valves, pumps, or other similar items with new items of the same size and type are not considered a material modification. Increasing system capacity occurs by adding a new water source to a PWS, increasing the pumping and hydraulic capacity of the PWS, increasing potable water demand, or increasing the number of service connections. Altering methods or processes employed occurs by adding new, or altering existing, system components to satisfy increasing potable water demand, or changing engineering design intent of potable water delivery or treatment. Maintenance as outlined in the approved operation and maintenance manual is not a material modification.
- 73. Maximum Contaminant Level (MCL). The maximum permissible level of a contaminant in water which is delivered to any user of a public water system. (3-24-22)
- 74. Maximum Day Demand. The average rate of consumption for the twenty four (24) hour period in which total consumption is the largest for the design year. See also the definition of Water Demand in these rules.

 (3-24-22)
- **7531. Maximum Pumping Capacity**. The pumping capacity with the largest source or pump out of service.
- 76. Maximum Residual Disinfectant Level (MRDL). A level of a disinfectant added for water treatment that may not be exceeded at the consumer's tap without an unacceptable possibility of adverse health effects. For chlorine and chloramines, a public water system is in compliance with the MRDL, when the running annual average of monthly averages of samples taken in the distribution system, computed quarterly, is less than or equal to the MRDL. For chlorine dioxide, a public water system is in compliance with the MRDL when daily samples are taken at the entrance to the distribution system and no two (2) consecutive daily samples exceed the MRDL. MRDLs are enforceable in the same manner as maximum contaminant levels under Section 1412 of the Safe

Drinking Water Act. There is convincing evidence that addition of a disinfectant is necessary for control of waterborne microbial contaminants. Notwithstanding the MRDLs listed in 40 CFR 141.65, operators may increase residual disinfectant levels of chlorine or chloramines (but not chlorine dioxide) in the distribution system to a level and for a time necessary to protect public health to address specific microbiological contamination problems caused by circumstances such as distribution line breaks, storm runoff events, source water contamination, or cross-connections.

- 77. Maximum Residual Disinfectant Level Goal (MRDLG). The maximum level of a disinfectant added for water treatment at which no known or anticipated adverse effect on the health of persons would occur, and which allows an adequate margin of safety. MRDLGs are nonenforceable health goals and do not reflect the benefit of the addition of the chemical for control of waterborne microbial contaminants.

 (3 24 22)
- 78. Membrane Filtration. A pressure or vacuum driven separation process in which particulate matter larger than one (1) micrometer (µm) is rejected by an engineered barrier, primarily through a size exclusion mechanism. This definition includes the common membrane technologies of microfiltration, ultrafiltration, nanofiltration, and reverse osmosis.

 (3-24-22)
- **7932. Membrane Unit**. A group of treatment systems or membrane modules that usually share common control and valving so that the group can be isolated for testing or cleaning.
- 80. Method Detection Limit (MDL). The lowest concentration which can be determined to be greater than zero with ninety-nine percent (99%) confidence, for a particular analytical method. (3-24-22)
- 8133. Microfiltration (MF). A low-pressure membrane filtration process with pore diameter normally in the range of 0.1 to 0.5 μ m.
- **8234. Module**. As the term relates to membrane filtration, it is the smallest component of a membrane unit in which a specific membrane surface area is housed. The component is typically equipped with a feedwater inlet, a filtrate outlet, and concentrate or backwash outlet structure.
- **8335. Nanofiltration (NF).** A membrane filtration process that removes dissolved constituents from water. Nanofiltration is similar to reverse osmosis but allows a higher percentage of certain ions to pass through the membrane. These systems typically operate under higher pressure than microfiltration and ultrafiltration.
- 84:36 New System. Any water system that meets, for the first time, the definition of a public water system provided in Section 1401 of the federal Safe Drinking Water Act (42 U.S.C. Section 300f). This includes PWS, which includes systems that are entirely new construction—and or previously unregulated systems that—are expanding increased either the population served or connections.

 (3-24-22)(_____)
- 85. Noncommunity Water System. A public water system that is not a community water system. A non-community water system is either a transient noncommunity water system or a non-transient noncommunity water system. See also the definition of a Public Drinking Water System in these rules.

 (3-24-22)
- **8637. Non-Potable Fluids or Gases.** Any fluids or gases that do not meet the definition of potable water. This definition also includes any gases that are heavier than air such as propane. (3-24-22)(_____)
 - 8738. Non-Potable Mains. Pipelines that collect, deliver, or otherwise convey non-potable fluids.
- 8839. Non-Potable Services or Lines. Pipelines that collect, deliver, or otherwise convey non-potable fluids to or from a non-potable main. These pipelines connect individual facilities to the non-potable main. This term also refers to pipelines that convey non-potable fluids from a pressurized irrigation system, reclaimed wastewater system, and other non-potable systems to individual consumers.
- 89. Nontransient Noncommunity Water System. A public water system that is not a community water system and that regularly serves at least twenty five (25) of the same persons over six (6) months per year. See also the definition of a Public Drinking Water System in these rules.

 (3-24-22)

- 9040. Operating Shift. That Any period of time during which water system operator decisions that affect public health are necessary for proper operation of the system a licensed operator must be present, or available, for proper operation or oversight of the PWS.

 (3-24-22)(____)
- **9141. Operational Storage**. Operational storage supplies water when, under normal conditions, the sources are off. This component is the larger of the volume required to prevent excess pump cycling and ensure that the following volume components are full and ready for use when needed or the volume needed to compensate for the sensitivity of the water level sensors. See also the definition of Components of Finished Water Storage in these rules.
- 9242. Operation and Maintenance Manual. An operation and maintenance manual A comprehensive document that provides procedures for the operations and maintenance of the PWS. The manual typically covers three main subjects: a water system specific operations plan (see definition of Operations Plan); maintenance information and checklists; and manufacturer's product information (including trouble shooting information, a parts list and parts order form, special tools, spare parts list, etc.). An operation and maintenance manual may cover every aspect of the water system or any part of the water system, including but not limited to the following: treatment, pump stations, storage reservoirs, distribution system, pressure reducing valve stations, etc.
- **9343. Operations Plan.** The operations plan is part of an operation and maintenance manual. Depending on which facilities of the <u>water system PWS</u> are being addressed, the operations plan may cover many types of information including but not limited to the following: daily, weekly, monthly, and yearly operating instructions; information specific to a particular type of treatment; location of valves and other key distribution system features; pertinent telephone and address contact information including the responsible charge <u>water system PWS</u> operator and <u>water system PWS</u> owner; operator safety procedures; alarm system; emergency procedures; trouble-shooting advice; water quality testing; depressurization events; customer service; and response to customer complaints.

(3.24.22)()

- 9444. Owner/Purveyor of Water/Supplier of Water. The person, company, corporation, association, or other organizational entity which holds legal title to the <u>public water system PWS</u>, who provides, or intends to provide, drinking water to the customers, and who is ultimately responsible for the <u>public water system PWS</u> operation.
- 95. Peak Hour Demand. The highest hourly flow, excluding fire flow, that a water system or distribution system pressure zone is likely to experience in the design year. See also the definition of Water Demand in these rules.
- **96. Person.** A human being, municipality, or other governmental or political subdivision or other public agency, or public or private corporation, any partnership, firm, association, or other organization, any receiver, trustee, assignee, agent or other legal representative of the foregoing or other legal entity.

 (3-24-22)
- **97. Pesticides.** Substances which meet the criteria for regulation pursuant to the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA), as amended, and any regulations adopted pursuant to FIFRA. For example, pesticides include, but are not limited to insecticides, fungicides, rodenticides, herbicides, and algaecides. (3 24 22)
- 9845. Plant Design Capacity. The maximum design flow through treatment units. The minimum plant design capacity could may be equal to peak hour demand but could may also be equal to the maximum day demand if equalization storage is provided.
 - 99<u>46</u>. Plant. A physical facility where drinking water or wastewater is treated or processed.
- 100. Point of Use (POU) Treatment Device. A treatment device applied to a single tap used for the purpose of reducing contaminants in drinking water at that one tap.

 (3-24-22)
 - **10147. Point of Use (POU) Treatment System.** A collection of POU treatment devices.

- 10248. Potable Mains. Pipelines that deliver potable water to multiple service connections.
- **10349. Potable Services.** Pipelines that convey potable water from a <u>service</u> connection to the potable water main to individual consumers.
- 10450. Potable Water. Water for human consumption.—See the definition of Water for Human Consumption in Section 003. Also referred to as Water for Human Consumption or Drinking Water. (3-24-22)(______)
- **10551.** Preliminary Engineering Report (PER). The preliminary engineering report for a public drinking water system facility is a∆ report that addresses specific portions of the system PWS or facility for which modifications are being designed. Modifications may include, but are not limited to, significant changes to existing processes or facilities, system PWS expansion, addition of treatment, or installation of other processes and facilities. This report addresses specific purpose and scope, design requirements, alternative solutions, costs, operation and maintenance requirements, and other requirements as described in Section 503. Preliminary engineering reports are generally project specific as opposed to an overall system-wide plan, such as a facility plan. (3-24-22)(______)
- 10652. Premises Isolation or Containment. The practice of separating the customer's structure, facility, or premises from the purveyor's system PWS by means of a backflow prevention assembly installed on the service line before any distribution takes place.
- 107. Presedimentation. A preliminary treatment process used to remove gravel, sand, and other particulate material from the source water through settling before the water enters the primary clarification and filtration processes in a treatment plant.

 (3 24 22)
- 10853. Protected Water Source. For the purposes of the Revised Total Coliform Rule (40 CFR Part 141, Subpart Y), a protected water source is a ground-water well that is not susceptible to contamination on the basis of well construction, hydrologic data, or contamination history.
- 10954. Public Notice. The notification of public water system to PWS consumers of information pertaining to that water system PWS including information regarding water quality or compliance status of the water system PWS.
- 11055. Public Drinking Water System (PWS). A system for the provision to the public of water for human consumption through pipes or, after August 5, 1998, other constructed conveyances, if such system has at least fifteen (15) service connections, regardless of the number of water sources or configuration of the distribution system, or regularly serves an average of at least twenty-five (25) individuals daily at least sixty (60) days out of the year. Such term includes: any collection, treatment, storage, and distribution facilities under the control of the operator of such system and used primarily in connection with such system; and any collection or pretreatment storage facilities not under such control which are used primarily in connection with such system. Such term does not include any "special irrigation district." A public water system is either a "community water system" or a "noncommunity water system" as further defined as:
- **a.** Community water system. A-public water system PWS which serves at least fifteen (15) service connections used by year-round residents or regularly serves at least twenty-five (25) year-round residents.

 $\frac{(3-24-22)}{(3-24-22)}$

- **b.** Non_community water system. A <u>public water system PWS</u> that is not a community water system. A non-community water system is either a transient non_community water system or a non-transient non_community water system.

 (3-24-22)(_____)
- c. Non_transient non_community water system. A <u>public water system PWS</u> that is not a community water system and that regularly serves at least twenty-five (25) of the same persons over six (6) months per year.
- d. Transient non_community—public water system. A non_community water system which does not regularly serve at least twenty-five (25) of the same persons over six (6) months per year.

- H156. Public Water System (PWS)/Water System/System. Means "public drinking water system."
- 41257. Pump House. A structure containing important water system components, such as a well, hydropneumatic tank, booster pump, pump controls, flow meter, well discharge line, or a treatment unit. Pump houses are often called well houses in common usage, even though in modern construction these structures may not contain either a well or a pump. These terms are used interchangeably in national standards and trade publications. ()
- 41358. Qualified Licensed Professional Engineer (QLPE). A professional engineer licensed by the state of Idaho; qualified by education or experience in the specific technical fields involved in these rules; and retained or employed by a city, county, quasi-municipal corporation, or regulated public utility for the purposes of plan and specification review.
- **11459. Quasi-Municipal Corporation**. A public entity, other than community government, created or authorized by the legislature to aid the state in, or to take charge of, some public or state work for the general welfare. For the purpose of these rules, this term refers to drinking water districts.
- **11661. Redundancy**. The installation of duplicate components or backup systems that are designed to maintain minimum pressure and capacity of the <u>system should PWS if</u> any component fails or <u>is</u> otherwise be out of service for maintenance or repair.

 (3 24 22)(____)
- 117. Regulated Public Utility. For the purpose of these rules, any public water system that falls under the jurisdiction of the Idaho Public Utilities Commission and is subject to the rules thereof. (3 24 22)
- **11862. Reverse Osmosis (RO).** A membrane filtration process that removes dissolved constituents from water. Reverse osmosis is similar to nanofiltration but allows a lower percentage of certain ions to pass through the membrane. These systems typically operate under higher pressure than microfiltration and ultrafiltration.
- 119. Repeat Compliance Period. Any subsequent compliance period after the initial compliance period. (3-24-22)
- **12063. Resolution**. As the term relates to membrane treatment, it is the size of the smallest integrity breach that contributes to a response from a direct integrity test when testing low pressure membranes.
- 121. Responsible Charge (RC). Responsible Charge means active, daily on site or on call responsibility for the performance of operations or active, on-going, on-site, or on-call direction of employees and assistants.
- **122.** Responsible Charge Operator. An operator of a public drinking water system, designated by the system owner, who holds a valid license at a class equal to or greater than the drinking water system classification, who is in responsible charge of the public drinking water system.

 (3 24 22)
- **12364. Reviewing Authority.** For those projects requiring preconstruction approval by the Department, the Department is the reviewing authority. For those projects allowing for preconstruction approval by others, pursuant to Subsection 504.03.b. of these rules, the qualified Idaho licensed professional engineer (QLPE) is also the reviewing authority.
 - **12465. Sampling Point**. The location in a public water system from which a sample is drawn. ()
- 125. Sanitary Defect. A defect that could provide a pathway of entry for microbial contamination into the distribution system or that is indicative of a failure or imminent failure in a barrier that is already in place. Examples of sanitary defects include but are not limited to: cross connections, inadequate distribution system pressures, inadequate or missing sanitary seal, improperly screened storage tank vents, inadequate protection from contamination during flooding, history of treatment failures, deterioration of system components, and water main

h.

(3-24-22)leaks or breaks.

126. Sanitary Survey. An onsite review of the water source, facilities, equipment, operation and maintenance of a public water system for the purpose of evaluating the adequacy of such source, facilities, equipment, operation and maintenance for producing and distributing safe drinking water. The sanitary survey will include, but is not limited to the following elements:

a.	Source;	(3-24-22)
b.	Treatment;	(3-24-22)
e.	Distribution system;	(3-24-22)
d.	Finished water storage;	(3 24 22)
e .	Pumps, pump facilities, and controls;	(3-24-22)
f.	Monitoring and reporting and data verification;	(3-24-22)
g.	System management and operation; and	(3-24-22)

SDWIS-State. An acronym that stands for "Safe Drinking Water Information System-State Version." It is a software package developed under contract to the U.S. Environmental Protection Agency and used by a majority of U.S. states to collect, maintain, and report data about regulated public water systems.

Operator compliance with state requirements.

- Seasonal System. A noncommunity water system that is not operated as a public water system on a year round basis and starts up and shuts down at the beginning and end of each operating season. (3 24 22)
- 12966. Sensitivity. As the term relates to membrane treatment, it is the maximum log removal value (LRV) for a specific resolution that can be reliably verified by the direct integrity test associated with a given low pressure membrane filtration system.
- Service Connection. Each structure, facility, or premises which is connected to a PWS water source, and which is or may be used for domestic purposes.
- 13068. Sewage. The wWater-carried human-or animal wastes from residences, buildings, and industrial establishments-or and other places, together with-such ground-water infiltration and surface water as may be present.
- 13169. Significant Deficiency. As identified during a sanitary survey, aAny defect in a system's PWS's design, operation, maintenance, or administration, as well as any failure or malfunction of any system component, that the Department or its agent determines to cause, or have potential to cause, risk to health or safety, or that could affect the reliable delivery of safe drinking water. See also the definition of Health Hazards the introduction of $\overline{(3-24-22)}$ (contamination into the water delivered to consumers.
- 13270. Simple Water Main Extension. New or replacement water main(s) that require plan and specification review by a qualified licensed professional engineer (QLPE) or by the Department per these rules and that is connected to existing water main facilities and does not require the addition of system components designed to control quantity or pressure, including, but not limited to, booster stations, new sources, pressure reducing valve stations, or reservoirs; and continues to provide the pressure and quantity requirements of Subsection 552.01.
- Special Irrigation District. An irrigation district in existence prior to May 18, 1994 that provides 133. primarily agricultural service through a piped water system with only incidental residential or similar use where the system or the residential or similar users of the system comply with the exclusion provisions in Section

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

1401(4)(B)(i)(II) or (III) of the Safe Drinking Water Act.

(3-24-22

- **13471. Spring.** A source of water which flows from a laterally percolating water table's intersection with the surface or from a geological fault that allows the flow of water from an artesian aquifer.
- 13572. Standby Storage. Standby storage provides a measure of reliability or safety factor should if sources fail or when unusual conditions impose higher than anticipated demands. See also the definition of Components of Finished Water Storage in these rules.
- 13673. Substantially Modified. The Department—shall considers a public water system PWS to be substantially modified when, as the result of one (1) or more projects material modifications to the PWS, there is a combined increase of twenty-five percent (25%) or more above the system's existing configurationin any one or combination of the following:—in the population served or number of service connections, the total length of transmission and distribution water mains, the source capacity, and or the peak or average water demand for the PWS. Material modifications completed after July 1, 2007, are the only modifications counted towards the twenty-five (25%) increase. Like-kind replacement of components will not be counted toward a combined increase of twenty-five percent (25%) calculation. Removal of existing system components will not be used to reduce the combined increase of twenty-five percent (25%) calculation.
- 13774. Substitute Responsible Charge Operator. An operator of a public drinking water system PWS who holds a valid license at a class equal to or greater than the drinking water system classification, designated by the system PWS owner to replace and to perform the duties of the responsible charge operator when the responsible charge operator is not available or accessible.
- **13875. Surface Water System**. A <u>public water system PWS</u> which is supplied by one (1) or more surface water sources or ground-water sources under the direct influence of surface water. Also called subpart H systems in applicable sections of 40 CFR Part 141.
- 139. Total Organic Carbon (TOC). Total organic carbon in mg/l measured using heat, oxygen, ultraviolet irradiation, chemical oxidants, or combinations of these oxidants that convert organic carbon to carbon dioxide, rounded to two (2) significant figures. (3-24-22)
- 140. Total Trihalomethanes (TTHM). The sum of the concentration in milligrams per liter of the trihalomethane compounds (trichloromethane [chloroform], dibromochloromethane, bromodichloromethane and tribromomethane [bromoform]), rounded to two (2) significant figures.
- 141. Transient Noncommunity Public Water System. A noncommunity water system which does not regularly serve at least twenty five (25) of the same persons over six (6) months per year. See also the definition of a Public Drinking Water System in these rules.

 (3-24-22)
- 14276. Treatment Facility. Any place(s) where a public drinking water system or nontransient noncommunity water system PWS alters the physical or chemical characteristics of the drinking water. Chlorination may be considered as a function of a distribution system.
- 14377. Turbidity. A mMeasure of the interference of light passage through water, or visual depth restriction due to from the presence of suspended matter such as clay, silt, nonliving organic particulates, plankton, and other microscopic organisms. Operationally, turbidity measurements are expressions of certain light—scattering and absorbing properties of a water sample. Turbidity is measured by the Nnephelometric method. (3-24-22)(______)
- 14478. Ultrafiltration (UF). A low pressure membrane filtration process with pore diameter normally in the range of five thousandths to one tenth micrometer $(0.005 \text{ to } 0.1 \, \mu\text{m})$.
- 145. Ultraviolet (UV) Light Technology. A physical disinfection process that has proven effective against common pathogens in drinking water. (3-24-22)
- 14679. UV Transmittance (UVT). A measure of the fraction of incident light transmitted through a material (e.g., water sample or quartz). The UVT is usually reported for a wavelength of two hundred fifty-four (254)

Page 653

following minim	General Variances. A general variance may be granted by the Department if a public water mits an application a written request and demonstrates to the satisfaction of the Department num requirements as required by of 42 USC Section 1415(a) (The Safe Drinking Water Accelude but are not limited to: (3. 24.2)	t that the tSDWA)

- i. The system has installed the best available technology, treatment techniques, or other means to comply with the maximum contaminant level; and (3-24-22)
 - ii. Alternative sources of water are not reasonably available to the system. (3-24-22)
- iii. For provisions of a national primary drinking water regulation which requires the use of a specific treatment technique with respect to a contaminant, the system must demonstrate that the technique is not necessary to protect the health of the system's customers.

 (3-24-22)
- **b.** Small System Variances. A small system variance for a maximum contaminant level or treatment technique may be granted by the Department if a <u>public water system PWS owner</u> submits an application a written request and demonstrates to the satisfaction of the Department that the following minimum requirements as required by of 42 USC Section 1415(e) (SDWA) are met. These include, but are not limited to:

 (3 24 22)(
 - i. The system serves three thousand three hundred (3,300) or fewer persons; (3-24-22)
- ii. If the system serves more than three thousand three hundred (3,300) persons but fewer than ten thousand (10,000) persons, the application shall be approved by the U.S. Environmental Protection Agency;
- iii. The U.S. Environmental Protection Agency has identified a variance technology that is applicable to the size and source water quality conditions of the public water system; (3 24 22)
- iv. The system installs, operates and maintains such treatment technology, treatment technique, or other means; and (3.24-22)
- v. The system cannot afford to comply with a national primary drinking water regulation in accordance with affordability criteria established by the Department, including compliance through treatment, alternative source of water supply, restructuring or consolidation.

 (3-24-22)
- **O34.** Exemptions. An exemption may be granted by the Department if a <u>public water system PWS</u> owner submits an <u>application a written request</u> and demonstrates to the satisfaction of the Department that the <u>following</u> minimum requirements as required by of 42 USC Section 1416(a) (SDWA) are met. These include but are not limited to:

 (3 24 22)(_____)
- a. The system is unable to comply with a maximum contaminant level or treatment technique due to compelling factors, which may include economic factors; (3-24-22)
- b. The system was in operation by the effective date of such contaminant level or treatment technique and no reasonable source of water is available to the system; or (3-24-22)
- e. If the system was not in operation by the effective date of such contaminant level or treatment technique, then no reasonable alternative source of water is available to the system; and (3-24-22)
 - d. The granting of an exemption will not result in an unreasonable risk to health; (3-24-22)
- e. Management or restructuring changes cannot reasonably be made to comply with the contaminant level or treatment technique to improve the quality of the drinking water; (3-24-22)
- The system cannot meet the standard without capital improvements which cannot be completed prior to the date established pursuant to 42 USC Section 1412b(10); (3-24-22)
- g. If the system needs financial assistance, the system has entered into an agreement to obtain such financial assistance; or (3-24-22)
 - h. The system has entered into an enforceable agreement to become a part of a regional public water

(3-24-22)

- **045. Conditions.** A waiver, exemption, or variance may be granted upon any conditions that the Department, in its discretion, determines are appropriate and in accordance with these rules. Failure by the public water system PWS owner to comply with any condition voids the waiver, variance, or exemption. (3 24 22)()
- **Public Hearing**. The Department—shall will provide public notice and an opportunity for public hearing in the area served by the public water system PWS before any exemption or variance under Section 005 is granted by the Department. At the conclusion of the hearing, the Department—shall will record the findings and issue a decision approving, denying, modifying, or conditioning the application request. (3-24-22)(_____)
- **Of.** Exceptions. Any person aggrieved by the Department's decision on a request for a waiver, variance or exemption may file a petition for a contested case with the Board. Such petitions shall be filed with the Board, as prescribed in, IDAPA 58.01.23, "Contested Case Rules and Rules for Protection and Disclosure of Records."

 (3-24-22)
- 97. Surface Water Variances. Variances from the requirements of Sections 300 through 303 are not allowed.
- 98. Surface Water Exemptions. Exemptions from 40 CFR 141.72(a)(3) and 40 CFR 141.72(b)(2) are not allowed.

006. SITING REQUIREMENTS.

40 CFR 141.5 is herein incorporated by reference.

 $\frac{(3-24-22)}{(3-24-22)}$

007. DISAPPROVAL DESIGNATION.

The Department-or its agent may assign a disapproved designation to a public water system PWS when:

(3-24-22)(

- **01. Defects.** There are design or construction defects, or some combination of design and construction defects significant deficiencies, or health hazards; or (3-24-22)(10)
 - **Operating Procedures.** Operating procedures constitute a health hazard; or (3-24-22)(
- **03.** Quality. Physical, Violations of chemical, microbiological or radiological quality does not meet the requirements maximum contaminant levels or action levels of these rules; or (3-24-22)(______)
- **04.** Monitoring. The required Violations of monitoring requirements as specified in these rules has not been conducted; or (3-24-22)(_____)
- **05. Unapproved Source**. An unapproved source of drinking water is used or the <u>system PWS</u> is interconnected with a disapproved water system. <u>i or</u> (3-24-22)(_____)
- **06. Non-Payment of Annual Fee Assessment**. The annual drinking water system fee assessment is not paid as set forth in Section 010.
- **Public Notification.** The Department may require the owner of a water system that has been given a disapproval designation to notify the public. The manner, content, and timing of this notification will be determined by the Department. This requirement is in addition to any public notification requirements set forth in Section 150 that may also apply to the disapproved system.

 (3 24 22)

008. HEALTH HAZARDS.

01. Prohibited. No PWS will:

(3-24-22)(____

a. No public water system, or portion of a public water system, shall cconstitute a health hazard, as determined by the Department and defined in Section 003 of these rules.

- **b.** No public water system, or portion of a public water system, shall eCreate a condition which prevents, or may prevent, the detection of a health hazard, as determined by the Department. (3-24-22)(_____)
- **O2. Schedule.** Health hazards and conditions which prevent, or may prevent, the detection of a health hazard must be mitigated as required by the Department, and terminated within a time schedule established, by the Department.

 (3-24-22)(_____)
- **85. Standards.** Design and construction revisions necessary to correct a health hazard or conditions which prevent, or may prevent, the detection of a health hazard, must be reviewed and approved by the Department, and comply with Sections 501 through 552, unless otherwise specified by the Department.

 (3 24 22)

909. MONITORING.

The Department may, in its discretion, alter the monitoring or sampling requirements for any contaminant otherwise specified in these rules if the Department determines that such alteration is necessary to adequately assess the level of such contamination.

(3-24-22)

04909. FEE SCHEDULE FOR PUBLIC DRINKING WATER SYSTEMS.

All <u>owners of regulated public drinking water systems shallPWSs must</u> pay an annual drinking water system fee. The fee-shall <u>will</u> be assessed to regulated public drinking water systems as provided in this section. <u>The Department may waive the requirements of this section at its discretion.

(3-24-22)(____)</u>

01. Effective Date. Annual fees-shall will be paid for each fee year. Fee years beginning on October 1, 1993, and continuing for each succeeding year of each calendar year.

02. Fee Schedule. (3-24-22)

a. Cowners of community and Nnon_transient non_community public drinking water systems PWSs must shall pay an annual fee according to the following fee schedule:

Number of Connections	Fee
1 to 20	\$100
21 to 184	\$5 per connection, not to exceed a total of \$735 per-system_ PWS
185 to 3,663	\$4 per connection, not to exceed a total of \$10,988 per-system_ PWS
3,664 or more	\$3 per connection

(3-24-22)(

- **b.** The annual fee for transient-public drinking water systems <u>PWSs</u> is twenty-five dollars (\$25).
- c. New-public drinking water systems PWSs formed after October 1 will not pay a fee until the following October.

03. Fee Assessment. ()

- a. An annual fee assessment will be generated for each community and non_transient non_community public drinking water system listed in the Department's Safe Drinking Water Information System (SDWIS) PWS using the number of connections the Department has on record.
- **b.** Community and non_transient non_community—<u>public drinking water systems PWSs</u> will be notified each year of the official number of connections listed in SDWIS.—<u>Systems PWSs</u> will have at least one (1)

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

month to notify the Department if the number of connections listed in SDWIS is provided are not in agreement with the system's PWS's records.

- e. The official number of connections listed in SDWIS following each yearly update, as required in Subsection 010.03.b., will be used to calculate the annual fee for community and nontransient noncommunity public drinking water systems for the next fee year of October 1 through September 30.

 (3-24-22)
- **O4.** Billing. An annual fee shall statement will be assessed and a statement will be mailed or delivered electronically to all-community, nontransient noncommunity, and transient public drinking water systems listed in SDWIS by PWS owners on record with the Department on or before by September 1 of each year and will include acceptable payment methods.

 (3 24 22)(_____)

05.	Payment. (.)

- a. Payment of the annual fee shallAnnual fee payment will be due on October 1, unless it is a Saturday, a Sunday, or a legal holiday, in which event the payment shall will be due on the successive business day. Fees paid by check or money order shall be made payable to the Idaho Department of Environmental Quality and sent to 1410 North Hilton Street, Boise, ID 83706-1255.
- **b.** If a <u>public water system PWS</u> consists of two hundred fifty (250) connections or more, the <u>system PWS</u> may request to divide its annual fee payment into equal monthly or quarterly installments by submitting a request to the Department—on the proper request form provided with the initial billing statement.

 (3-24-22)(_____)
- ei. The Department will notify—applicable systems, in writing, PWSs of approval or denial of a requested monthly or quarterly installment plan within ten (10) business days of the Department receiving such a the request.

 (3 24 22)(_____)
- di. If a public water system PWS has been approved to pay monthly installments then each installment shall will be due by the first day of each month, unless it is a Saturday, a Sunday, or a legal holiday, in which event the installment shall will be due on the successive business day.
- eiii. If a <u>public water system PWS</u> has been approved to pay quarterly installments then each installment-shall will be due by the first day of the month of each quarter (October 1, January 1, April 1, and July 1), unless it is a Saturday, a Sunday, or a legal holiday, in which event the installment-shall will be due on the first successive business day.

 (3 24 22)(_____)
- **Delinquent Unpaid Fees.** A public water system PWS owner will be delinquent in payment if its annual fee assessment has not been received by the Department by November 1; or if having first opted to pay monthly or quarterly installments, its monthly or quarterly installment has not been received by the Department by the last day of the month in which the monthly or quarterly payment is due.

07. Suspension of Services and Disapproval Designation.

a. For any <u>system PWS owner</u> delinquent in payment of fee assessed under Subsections 010.02-and 010.06, in excess of ninety (90) days, technical <u>services assistance</u> provided by the Department may be suspended except for the following review and processing of:

- i. Issuance of mMonitoring waivers; (3-24-22)(
- ii. Review and processing of eEngineering reports; and (3 24 22)(
- iii. Review of pPlans and specifications for design and construction as set forth in Sections 501 500 (3.24.22)(
- **b.** For any <u>system PWS owner</u> delinquent in payment of fee assessed under Subsections 010.02-and 010.06, in excess of one hundred and eighty (180) days, the Department <u>may disapprove the PWS pursuant to Subsection 007.06 and may suspend all technical services assistance</u> provided by the Department including any of the

)

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

following review and processing of:

3-24-22)(

i. Review and processing of eEngineering reports;

- (3-24-22)(
- ii. Review of pPlans and specifications for design and construction as set forth in Sections 501_500 through 552; or (3-24-22)(_____)
 - iii. Renewal of mMonitoring waivers; or (3 24 22)
 - iv. Granting of new monitoring waivers. (3-24-22
- e. For any system delinquent in payment of fee assessed under Subsections 010.02 and 010.06, in excess of one hundred and eighty (180) days, the Department may disapprove the public water system pursuant to Subsection 007.06.
- **Owner** for which delinquency of fee payment, pursuant to Subsection 010.07, has resulted in the suspension of technical services assistance, the disapproval of a public water system, or both has occurred, continuation reinstatement of technical services assistance, reinstatement of public water system approval, or both, will occur upon payment of delinquent annual fee assessments.

 (3 24 22)(____)
- **O9.** Enforcement Action. Nothing in Section 010 waives the Department's right to undertake an enforcement action at any time, including seeking penalties, as provided in Section 39 108, Idaho Code. (3 24 22)
- 10-09 Responsibility to Comply. Subsection 010.07-shall in no way relieves any system PWS from its obligation to comply with all applicable state and federal drinking water statutes, rules, regulations, or orders these rules.

011. CONTINUITY OF SERVICE.

- **01.** Transfer of Ownership. No owner-shall may transfer system PWS ownership without providing written notice to the Department and all customers. Notification—shall must include a schedule for transferring responsibilities and identification of the new owner.
- **O2.** Maintenance of Standards. The <u>system current PWS owner</u> transferring ownership <u>shall must</u> ensure that all <u>health related standards these rules</u> are met during transfer and <u>shall will</u> ensure that water rights, operation and maintenance manuals, and all other pertinent <u>rights and</u> documentation <u>is are</u> transferred to the new owner.

012. WRITTEN INTERPRETATIONS.

The Department of Environmental Quality may have written statements in the form of guidance and policy documents that pertain to the interpretation of the rules of this chapter. Such written statements may be inspected and eopies obtained at the Department of Environmental Quality, 1410 North Hilton, Boise, Idaho 83706-1255.

(3 24 22)

013. USE OF GUIDANCE.

Guidance documents referenced in these rules are to be used to assist both designers and reviewers in determining a reasonable way to achieve compliance with the rules. Nothing in these rules makes the use of a particular guidance or guidance document mandatory. If the plans and specifications comply with applicable facility and design standards as set out in these rules, Section 39-118, Idaho Code, requires that the Department not substitute its judgment for that of the design engineer concerning the manner of compliance. If the design engineer needs assistance as to how to comply with a particular rule, the design engineer may use the referenced guidance documents for that assistance. However, the design engineer may also use other guidance or provide documentation to substantiate his or her own professional judgment.

01412. ADMINISTRATIVE PROVISIONS.

Persons may be entitled to appeal agency actions authorized under these rules pursuant to IDAPA 58.01.23,

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

"Contested Case Rules and Rules for Protection and Disclosure of Records."

01315. CONFIDENTIALITY OF RECORDS.

Information obtained by the Department under these rules is subject to public disclosure pursuant to the provisions of Chapter 1, Title 74, Idaho Code. Information submitted under a trade secret claim may be entitled to confidential treatment by the Department as provided in Section 74-114107, Idaho Code, and IDAPA 58.01.21, "Rules Governing the Protection and Disclosure of Records in the Possession of the Department of Environmental Quality." and IDAPA 58.01.23, "Contested Case Rules and Rules for Protection and Disclosure of Records."

016. OFFICE HOURS -- MAILING ADDRESS AND STREET ADDRESS.

The state office of the Department of Environmental Quality and the office of the Board of Environmental Quality are located at 1410 N. Hilton, Boise, Idaho 83706-1255, telephone number (208) 373-0502. The office hours are 8 a.m. to 5 p.m. Monday through Friday.

300. FILTRATION AND DISINFECTION.

- **O1.** General Requirements. 40 CFR 141.70 is herein incorporated by reference. Each public water system using a surface water source or ground water source directly influenced by surface water shall be operated by personnel, as specified in Sections 553 and 554, who have met state requirements for licensing of water system operators.

 (3.24-22)(______)
 - **02. Filtration.** 40 CFR 141.73 is herein incorporated by reference. (3-24-22)
- **a.** Each system which provides filtration treatment shall submit engineering evaluations, other documentation, or some combination of engineering evaluations and other documentation as required by the Department to demonstrate ongoing compliance with these rules.

 (3 24 22)

ba. The Department will establish filtration removal credit on a system-by-system basis. Unless otherwise-demonstrated to the satisfaction of allowed the Department, the maximum log removal credit allowed for filtration is as follows:

	Maximum Log Removal										
Filtration Type	Giardia lamblia	Viruses	Cryptosporidium								
Conventional	2.5	2.0	2.5								
Direct	2.0	1.0	2.0								
Slow sand	2.0	2.0	2.0								
Diatomaceous earth	2.0	1.0	2.0								
Microfiltration	3.0	0.5	3.0								
Ultrafiltration	3.5	2.0	3.5								
Nanofiltration	4.0	3.0	4.0								
Reverse Osmosis	4.0	3.0	4.0								
Alternate technology	2.0	0	2.0								

(3-24-22)(____)

- eb. Filtration removal credit-shall will be granted for filtration treatment provided the system PWS is: (3-24-22)(
- i. Operated in accordance with the Operations Plan specified in Subsection 552.03.a.; and ()
- ii. The <u>system PWS</u> is in compliance with the turbidity performance criteria specified under 40 CFR (3-24-22)(____)
- iii. Coagulant chemicals must be added and coagulation and flocculation unit process must be used at all times during which conventional and direct filtration treatment plants are in operation; and
- iv. Slow sand filters are operated at rates not to exceed one-tenth (0.1) gallons per minute per square foot or as approved by the Department; and (
- v. Diatomaceous earth filters are operated at a rate not to exceed one point five (1.5) gallons per minute per square foot.
 - **O3.** Criteria for Avoiding Filtration. 40 CFR 141.71 is herein incorporated by reference.

 $\frac{(3-24-22)}{(3-24-22)}$

04. Disinfection. 40 CFR 141.72 is herein incorporated by reference.

(3 24 22)(____

- a. In addition to the disinfection requirements in 40 CFR 141.72, each system with a sSurface water sources or ground-water sources directly influenced by surface water shall must maintain a minimum of at least two-tenths (0.2) parts per million of chlorine mg/l disinfectant residual in the treated water after an effective contact time of at least thirty (30) minutes at peak hour demand before delivery to the first customer. Effective contact time is either demonstrated or calculated.
- i. Demonstrated effective contact time is generally determined by tracer studies on a completed contact basin. Prior to conducting a tracer study, a testing plan shall be submitted to the Department for review and approval. The tracer chemical shall not be reactive with anything in the water or be consumed in the process.

(3-24-22)

- ii. Calculated effective contact time for tank type contact basins is based on tank baffling and inlet/outlet configurations for the maximum hourly flow rate through that contact basin. Calculated effective contact time in a "pipeline type contact basin" (often called a pipeline contactor) is calculated by dividing the internal volume of the pipe by the maximum hourly flow rate through that pipeline contactor.

 (3 24 22)
- **b.** The Department may allow a <u>system PWS</u> to utilize automatic shut-off of water to the distribution system whenever total disinfectant residual is less than two-tenths (0.2) mg/l rather than provide redundant disinfection components and auxiliary power as required in 40 CFR 141.72(a)(2). An automatic water shut-off may be used if the <u>system PWS</u> demonstrates to the satisfaction of the Department that, at all times, a minimum of twenty (20) psi pressure and adequate fire flow can be maintained in the distribution system when water delivery is shut-off to the distribution system and, at all times, minimum Giardia lamblia and virus inactivation removal rates can be achieved prior to the first customer.
- c. Each system PWS which is required to provide filtration must provide disinfection treatment such that filtration plus disinfection provide at least 3-Log or ninety-nine and nine tenths percent (99.9%) inactivation/removal of Giardia lamblia cysts and at least 4-Log or ninety-nine and ninety-nine hundredths percent (99.99%) inactivation/removal of viruses as specified in 40 CFR 141.72 and Section 300, and at least 2-Log or ninety-nine percent (99%) removal of Cryptosporidium as required by 40 CFR Part 141, Subpart P or Subpart T. However, in all cases the disinfection portion of the treatment train-shall must be designed to provide not less than five tenths (0.5) log Giardia lamblia inactivation, irrespective of the Giardia lamblia removal credit awarded to the filtration portion of the treatment train.
 - **O5.** Analytical and Monitoring Requirements. 40 CFR 141.74 is herein incorporated by reference.
 - **Each** public water system which is required to provide disinfection shall monitor as follows:

 (3-24-22)
- i. Each day the system is in operation, the purveyor shall determine the total level of inactivation of Giardia lamblia cysts and viruses achieved through disinfection based on CT99.9 values provided in 40 CFR 141.74(b)(3) (Tables 1.1 through 1.6, 2.1 and 3.1).
- ii. At least once per day, the system shall monitor the following parameters to determine the total inactivation ratio achieved through disinfection:

 (3 24 22)
- (1) Temperature of the disinfected water at each residual disinfectant concentration sampling point; and
 - (2) If using chlorine, the pH of the disinfected water at each chlorine residual sampling point.
- (3) The effective contact time, "T," must be determined each day during peak hour demand. Disinfectant contact time, "T," in pipelines used for Giardia lamblia and virus inactivation shall be calculated by dividing the internal volume of the pipe by the peak hour flow rate through that pipe. Effective contact time, "T," for all other system components used for Giardia lamblia and virus inactivation shall be determined by tracer studies or other evaluations or calculations acceptable to the Department.
- (4) The residual disinfectant concentrations at each residual disinfectant sampling point at or before the first customer, must be determined each day during peak hour demand, or at other times approved by the Department.
- iii. The purveyor may demonstrate to the Department, based on a Department approved on site disinfection challenge study protocol, that the system is achieving disinfection requirements specified in Subsection 300.04 utilizing CT99.9 values other than those specified in 40 CFR 141.74(b)(3) (Tables 2.1 and 3.1) for ozone, chlorine dioxide, and chloramine.

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

iv.a. The tTotal inactivation ratio shall be calculated as follows calculations: 40 CFR 141.74(b)(4)(i) and (ii) are incorporated by reference.: (3 24 22)(_____)

- (1) If the system applies disinfectant at only one (1) point, the system shall determine the total inactivation ratio by either of the two (2) following methods:

 (3 24 22)
- (a) One inactivation ratio (CTcalc/CT99.9) is determined at/or before the first customer during peak hour demand; or (3-24-22)
- (b) Sequential inactivation ratios are calculated between the point of disinfectant application and a point at or before the first customer during peak hour demand. The following method must be used to calculate the total inactivation ratio:

 (3-24-22)
 - (i) Step 1: Determine (CTcalc/CT99.9) for each sequence. (3.24-22)
 - (ii) Step 2: Add the (CTeale/CT99.9) values for all sequences. The result is the total inactivation ratio.
- (2) If the system uses more than one point of disinfectant application at or before the first customer, the system must determine the CT value of each disinfection sequence immediately prior to the next point of disinfectant application during peak hour demand. The sum of the (CTeale/CT99.9) values from all sequences is the total inactivation ratio. (CTeale/CT99.9) must be determined by the methods described in 40 CFR 141.74(b)(4)(i)(B).

 (3. 24. 22)
- *-b. Log removal credit for disinfection-shall must be determined by multiplying the total inactivation ratio by three (3).
- vi. The Department may reduce the CT monitoring requirements specified under Section 300, for any system which demonstrates that the required inactivation levels are consistently exceeded. Reduced CT monitoring shall be allowed only where the reduction in monitoring will not endanger the health of consumers served by the water system.

 (3-24-22)
- **b.** Residual disinfectant concentrations for ozone must be measured using the Indigo Method, or automated methods may be used if approved by the Department as provided for in 40 CFR 141.74(a)(2). (3-24-22)
 - **c.** Unfiltered Subpart H systems. 40 CFR 141.857(c) is herein incorporated by reference.

(3-24-22)()

d. As provided for in 40 CFR 141.74(b), the Department may specify interim monitoring requirements for unfiltered systems notified by the Department or U.S. Environmental Protection Agency that filtration treatment must be installed. Until filtration is installed, systems shall conduct monitoring for turbidity and disinfectant residuals as follows unless otherwise specified by the Department. Unfiltered PWSs must monitor as required in 40 CFR 141.74(b) upon notification by the Department that filtration treatment must be installed.

(3 24 22)()

i. Disinfectant residual concentrations entering the distribution system shall be measured at the following minimum frequencies, and samples must be taken at evenly spaced intervals throughout the workday.

Minimum F	requencies
Population	Samples/day
-Less than 500	1
-501 - 1000	5
-1,001 - 2,500 -	ф

Mi				
		***********		****

eater tha	n 2501	······································		****
	Populat	Population	Fopulation Sampl	Population Samples/day

3 24 22

- ii. Turbidity shall be measured at least once per day at the entry point to the distribution system.

 (3-24-22)
- <u>iii.e.</u> <u>During the period prior to filtration treatment installation.</u> The Department may, at its discretion, reduce the turbidity monitoring frequency for any non-community system which demonstrates to the satisfaction of the Department:
- (1)i. A free chlorine residual of two-tenths (0.2) part per million is maintained throughout the distribution system;
 - (2)<u>ii.</u> The water source is well protected; ()
- (3)<u>iii.</u> The total coliformE. coli MCL is not exceeded or a Level 1 or Level 2 Assessment has not been triggered in accordance with 40 CFR 141.859; and
 - (4)iv. No significant health risk is present.
- The Department may allow systems with surface water sources or ground water sources under the direct influence of surface water, to substitute continuous turbidity monitoring for grab sample monitoring as specified in 40 CFR 141.74(b)(2) and 40 CFR 141.74(c)(1) and Subsection 300.05. The Department may allow continuous turbidity monitoring provided the continuous turbidimeter is operated, maintained, standardized and calibrated per the manufacturer's recommendations. For purposes of determining compliance with turbidity performance criteria, discrete values must be recorded every four (4) hours water is supplied to the distribution system.
- The Department may allow systems using both a surface water source(s), or ground water source(s) under the direct influence of surface water, and one (1) or more ground water sources, to measure disinfectant residual at points other than the total coliform sampling points, as specified in 40 CFR 141.74(b)(6)(i) and 40 CFR 141.74(e)(3)(i) and Subsection 300.05. The Department may allow alternate sampling points provided the system submits an alternate monitoring plan to the Department for approval in advance of the monitoring requirement that demonstrates the alternative points are more representative of treated (disinfected) water quality within the distribution system. Heterotrophic bacteria, measured as heterotrophic plate count (HPC) as specified in 40 CFR 141.74(a)(1), may be measured in lieu of residual disinfectant concentration as outlined in 40 CFR 141.74(b)(6)(i).
- The Department may allow a reduced turbidity monitoring frequency for systems using slow sand filtration or technology other than conventional, direct, or diatomaceous earth filtration, as specified in 40 CFR 141.74(e)(1) and Subsection 300.05. To be considered for a reduced turbidity monitoring frequency, a system must submit a written request to the Department in advance of the monitoring requirement. (3 24 22)
- **Reporting and Recordkeeping Requirements.** 40 CFR 141.75 is herein incorporated by reference.
- **a.** As provided in 40 CFR 141.75(a) and Section 300, the Department may establish interim reporting requirements for <u>systems PWSs</u> notified by the Department or U.S. Environmental Protection Agency that filtration treatment must be installed as specified in 40 CFR 141.75(a) and as referred to in Subsection 300.06. Until filtration treatment is installed, <u>systems PWSs</u> required to install filtration treatment—<u>shall must</u> report as follows:

<u>c.</u> the distribution s	Distribution system: A minimum system pressure of twenty (20) psi is not maintained throughout ystem as specified in Subsection 552.01.b.
<u>d.</u>	Finished water storage: Roof leaking, as specified in Subsections 544.09 and 544.09.c. ()
e. unauthorized ent	Pumps, pump facilities, and controls: A pump house must be protected from contamination and ry, as specified in Subsection 541.01.
<u>f.</u>	Monitoring, reporting, and data verification: Repeated failure to collect the required number and

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

type of Total Coliform Rule or the Revised Total Coliform Rule samples during the most recent two (2) year period, as specified in Subsection 100.01.

- **g.** PWS management and operation: History of frequent depressurization in the distribution system in violation of Subsection 552.01.
- <u>h.</u> Operator compliance with state licensing requirements: The PWS does not have a properly licensed responsible charge operator as required in Subsection 554.02.
- **034. Response Required.** TAfter notification from the Department of significant deficiencies, the owner of a public water system PWS must respond in writing, describing how and on what schedule the system PWS will address all significant deficiencies, not later than forty-five (45) days after receiving notification from the Department for PWSs using surface water or groundwater under the direct influence of surface water or thirty (30) days for PWSs only using groundwater.
- **045. Consultation with the Department.** Public water systems shallPWS owners must consult with the Department prior to taking specific corrective actions in response to significant deficiencies identified during a sanitary survey, unless such corrective actions are specified in detail by the Department in its written notification under Subsection 302.02.
- **Violation**. Failure to address significant deficiencies identified in a sanitary survey that are within the control of the public water system and its governing body shall constitute is a violation of these rules.

(3-24-22)(

303. SANITARY SURVEYS FOR PUBLIC WATER SYSTEMS USING GROUND WATER.

The Department shall conduct a sanitary survey of all public water systems that use ground water. 40 CFR Part 141, Subpart S, is herein incorporated by reference.

(3-24-22)

- **91.** Frequency. For non-community water systems, a sanitary survey shall be conducted every five (5) years. For community water systems, a sanitary survey shall be conducted every three (3) years, except as provided below.

 (3-24-22)
- **a.** A community water system may have a sanitary survey conducted every five (5) years if the system provides at least a four (4) log treatment of viruses (using inactivation, removal, or a Department approved combination of 4-log inactivation and removal) before or at the first customer for all of its ground water sources.
- **b.** A community water system may have a sanitary survey conducted every five (5) years if it has an outstanding performance record, as determined by the Department and documented in previous sanitary surveys, and has no history of Total Coliform Rule or Revised Total Coliform Rule MCL or monitoring violations under Subsection 100.01 since the last sanitary survey.

 (3-24-22)
 - **Report.** A report describing the results of the sanitary survey shall be provided to the water system.
- As part of the sanitary survey report or as an independent action, the Department shall provide written notice to the water system describing any significant deficiency within thirty (30) days after the Department identifies the significant deficiency. The notice may specify corrective actions and deadlines for completion of corrective actions.

 (3-24-22)
 - The Department may, at its discretion, provide this written notice at the time of the sanitary survey.

 (3-24-22)
- 93. Significant Deficiencies. For each of the eight (8) elements of a sanitary survey of a ground water system, the following deficiencies shall in all cases be considered significant for the purposes of the notice required in Subsection 303.02. Decisions about the significance of other deficiencies identified during the sanitary survey shall

- **Q4.** Response Required. The owner of a public water system must respond in writing, describing how and on what schedule the system will address all significant deficiencies, not later than thirty (30) days after receiving notification from the Department.

 (3-24-22)
- 05. Consultation with the Department. Public water systems shall consult with the Department prior to taking specific corrective actions in response to significant deficiencies identified during a sanitary survey unless such corrective actions are specified in detail by the Department in its written notification under Subsection 303.02.
- **Violation.** Failure to address significant deficiencies identified in a sanitary survey that are within the control of the public water system and its governing body shall constitute a violation of these rules. (3-24-22)

304. COMPOSITE CORRECTION PROGRAM (CCP).

- 40 CFR 141.563 is incorporated by reference. In accordance with 40 CFR 142.16(g)(1), the Department—may has authority to require the owner of a public water system PWC to conduct a composite correction program, as defined in Section 003—of these rules, for the purpose of identifying and correcting deficiencies in water treatment and distribution. Composite Correction Programs consist of a Comprehensive Performance Evaluation (CPE) and Comprehensive Technical Assistance (CTA). Failure to implement any Department required performance improvement factors identified through the CCP constitutes a violation of these rules.
- O1. Comprehensive Performance Evaluation (CPE). If required, the CPE must be The CPE is conducted to identify factors that may be adversely impacting a plant's capability to achieve compliance. It must emphasize approaches that can be implemented without significant capital improvements, and must consist of at least the following components: assessment of plant performance; evaluation of major unit processes; identification and prioritization of performance limiting factors; assessment of the applicability of comprehensive technical assistance; and preparation of a CPE report. The CPE assesses plant performance-based capabilities and associated administrative and operation and management practices.

 (3 24 22)(____)

O2. Comprehensive Technical Assistance (CTA). During the CTA phase, the system must identify and systematically address plant specific factors. The CTA consists of follow-up to the CPE results, implementation of process control priority setting techniques, and maintaining long-term involvement to systematically train staff and administrators.

(3-24-22)

305. COLIFORM TREATMENT TECHNIQUE TRIGGERS AND ASSESSMENT REQUIREMENTS FOR PROTECTION AGAINST POTENTIAL FECAL CONTAMINATION.

40 CFR 141.859, excluding 40 CFR 141.859(a)(2)(iii), is herein incorporated by reference.

(3 24 22)(

O1. Treatment Technique Triggers. Systems owners and operators must ensure that assessments are conducted in accordance with Subsection 305.02 after exceeding treatment technique triggers in this subsection.

(3.24.22)

a. Level 1 treatment technique triggers:

- (3 24 22)
- i. For systems taking forty (40) or more samples per month, the system exceeds five percent (5.0%) total coliform positive samples for the month.
- ii. For systems taking fewer than forty (40) samples per month, the system has two (2) or more total coliform positive samples in the same month.

 (3-24-22)
- iii. The system owner or operator fails to take every required repeat sample after any single total coliform positive sample.

 (3 24 22)
 - **b.** Level 2 treatment technique triggers:

(3-24-22)

- i. An E.coli MCL violation, as specified in Subsection 050.05 and Subsection 100.01 of these rules;
 or (3-24-22)
- ii. A second or any additional Level 1 triggers as defined in Subsection 305.01.a. within a rolling 12-month period, unless the Department has determined a likely reason that the samples that caused the first Level 1 treatment technique trigger were total coliform positive and has established that the system has corrected the problem.

 (3-24-22)
 - 021. Requirements For Assessments. 40 CFR 141.859(b) is incorporated by reference.

(3-24-22)(

- a. System owners and operators must ensure that Level 1 and 2 assessments are conducted in order to identify the possible presence of sanitary defects and defects in distribution system coliform monitoring practices. The Level 1 and 2 assessments must be conducted consistent with any Department directives that tailor specific assessment elements with respect to the size and type of the system PWS and the size, type, and characteristics of the distribution system.

 (3-24-22)(______)
- when conducting assessments, owners and operators must ensure that the assessor evaluates minimum elements that include review and identification of inadequacies in sample sites; sampling protocol; sample processing; atypical events that could affect distributed water quality or indicate that distributed water quality was impaired; changes in distribution system maintenance and operation that could affect distributed water quality (including water storage); source and treatment considerations that bear on distributed water quality, where appropriate (e.g., small ground water systems); and existing water quality monitoring data. The system owner or operator must ensure the assessments are consistent with the elements in the Department provided forms for Level 1 and Level 2 assessments.
- eb. Level 1 Assessment s. A system owner or operator must conduct a Level 1 assessment if the system exceeds one of the treatment technique triggers in Subsection 305.01.a. as soon as practical after any trigger level is identified and submit a completed Level 1 assessment report or form to the Department within thirty (30) days after the system learns that it has exceeded a trigger. 40 CFR 141.859(b)(3) is incorporated by reference. (3 24 22)()

- i. The completed assessment report or form must describe sanitary defects detected, corrective actions completed, and a proposed timetable for any corrective actions not already completed. The assessment report or form may also note that no sanitary defects were identified.

 (3-24-22)
- ii. If the Department reviews the completed Level 1 report or form and determines that the assessment is not sufficient (including any proposed timetable for any corrective actions not already completed), the Department will consult with the owner or operator of the system. If the Department requires revisions after consultation, the system owner or operator must submit a revised assessment report or form to the Department on an agreed upon schedule not to exceed thirty (30) days from the date of consultation.

 (3-24-22)
- iii. Upon completion and submission of the assessment report or form by the system owner or operator, the Department will determine if the system has identified a likely cause for the Level 1 trigger and, if so, establish that the system has corrected the problem, or has included a schedule acceptable to the Department for correcting the problem.

 (3-24-22)
- dc. Level 2 Assessments. A system owner or operator must ensure that a Level 2 assessment is conducted if the system exceeds one of the treatment technique triggers in Subsection 305.01.b. The owner or operator must comply with any expedited actions or additional action required by the Department in the case of an E.coli MCL violation. 40 CFR 141.859(b)(4) is incorporated by reference.
- i. The system owner or operator must ensure that a Level 2 assessment is conducted by the Department or a party approved by the Department as described in Subsection 305.03 as soon as practical after any trigger in Subsection 305.01.b. and must submit a completed Level 2 assessment report or form to the Department within 30 (thirty) days after the system learns that it has exceeded a trigger if the assessment was conducted by a party other than the Department.

 (3-24-22)
- The Department will schedule and conduct Level 2 assessments for an E.coli treatment technique trigger in Subsection 305.01.b.i. unless the Department approves another party to conduct the assessment as outlined in Subsection 305.0302.
- iii. A second or any additional triggered Level 2 Assessment within a rolling twelve-month period must be conducted by a Department approved third party even if the <u>public water system PWS owner</u> has staff or management approved under Subsection 305.0302.
- iv. The completed assessment report or form must describe sanitary defects detected, corrective actions completed, and a proposed timetable for any corrective actions not already completed. The assessment report or form may also note that no sanitary defects were identified.

 (3-24-22)
- v. If the Department reviews the completed Level 2 report or form and determines that the assessment is not sufficient (including any proposed timetable for any corrective actions not already completed), the Department will consult with the owner or operator of the system. If the Department requires revisions after consultation, the system owner or operator must submit a revised assessment report or form to the Department on an agreed-upon schedule not to exceed 30 (thirty) days from the date of consultation.

 (3-24-22)
- vi. Upon completion and submission of the assessment report or form by the system owner or operator, the Department will determine if the system has identified a likely cause for the Level 2 trigger and, if so, establish that the system has corrected the problem, or has included a schedule acceptable to Department for correcting the problem.

 (3-24-22)
- en Corrective action. Systems must correct sanitary defects found through either Level 1 or Level 2 assessments conducted under this section. For corrections not completed by the time of submission of the assessment report or form, the system must complete the corrective action(s) in compliance with a timetable approved by the Department in consultation with the system. The system must notify the Department when each scheduled corrective action is completed.

 (3-24-22)
- f. Consultation. At any time during the assessment or corrective action phase, either the water system or the Department may request a consultation with the other party to determine the appropriate actions to be taken.

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

The system may consult with the Department on all relevant information that may impact its ability to comply with a requirement of this Section, including the method of accomplishment, an appropriate timeframe, and other relevant information.

(3-24-22)

- **032. Approved Parties for Level 2 Assessments**. The <u>system PWS</u> may conduct a Level 2 assessment if the <u>system PWS</u> has staff or management with the certification or qualifications outlined in this Subsection or if the <u>system PWS</u> hires parties that meet the qualifications in this Subsection. The following parties are approved by the Department to conduct Level 2 assessments:

 (3 24 22)()
- a. The Department or persons contracted with the Department who are trained to conduct sanitary surveys;
- **b.** Currently licensed operators in good standing that are licensed through the Idaho Division of Occupational and Professional Licenses with a drinking water classification of Distribution I through IV or Treatment I through IV and that are licensed at least to the classification level of the <u>public water system PWS</u> requiring the Level 2 assessment; or

 (3-24-22)(

)
- **c.** Licensed professional engineers licensed by the state of Idaho and qualified by education and experience in the specific technical fields involved in these rules.

(3 24 22)(____

- **01.** Cryptosporidium Treatment Credit for Approved Watershed Control Program. The Department—shall will award 0.5 (zero point five) logs cryptosporidium removal credit to systems that have a Department approved Watershed Control Program. Requirements for a watershed control program are set forth in 40 CFR 141, Subpart W. Guidance on how to develop a watershed control program and obtain Department approval is provided in "Implementation Guidance for the Long Term 2 Enhanced Surface Water Treatment Rule," as referenced in Section 002.
- **O2.** Assessment of Significant Changes in the Watershed. As part of the sanitary survey process set forth in Section 302, the Department, or an agent approved by the Department, shall will assess significant changes in the watershed of a surface water system that have occurred since the system PWS conducted source water monitoring. If changes in the watershed have the potential to significantly increase contamination of the source water with cryptosporidium, the Department shall will consult with the water system PWS owner on follow-up actions that may be required under 40 CFR 141, Subpart W, including, but not limited to, source water monitoring and/or additional treatment requirements. "Implementation Guidance for the Long Term 2 Enhanced Surface Water Treatment Rule," as referenced in Section 002, provides a description of factors that will be considered by the Department when making an assessment of changes in the watershed. These factors include, but are not limited to the following:
- **a.** New-NPDES IPDES permits or changes in existing-NPDES IPDES permits that involve increased loading of contaminants. (3-24-22)(_____)

b.	Changes in land use patterns.	()	
υ.	Changes in land use patterns.	.)	,

- **c.** Changes in agricultural cropping, chemical application, or irrigation practices.
- **d.** Changes in other non-point discharge source activities (such as grazing, manure application, commercial or residential development).

500. FACILITY AND DESIGN STANDARDS: DEMONSTRATION OF TECHNICAL, FINANCIAL, AND MANAGERIAL CAPACITY OF PUBLIC DRINKING WATER SYSTEMS.

No person-shall may proceed, or cause to proceed, with construction of a new or substantially modified community or non-transient, non-community—drinking water system PWS until—it has been they have demonstrated to the Department that the water system PWS will have adequate technical, financial, and managerial capacity, as defined in Section 003_of these rules. Existing community or non-transient, non-community PWSs with technical, financial, or managerial problems, as determined by the Department, may be required to submit technical, financial, and managerial documentation to the Department for review and approval. With the exception of water sources, demonstration of capacity—shall must be submitted to the Department prior to or concurrent with the submittal of plans and specifications, as required in Section 39-118, Idaho Code, and Subsection 504.03—of these rules. Plans and specifications for water sources may be submitted to the Department prior to demonstration of capacity for the water system PWS. The Department—shall will issue its approval of the new-system PWS capacity demonstration in writing.

- 01. Technical Capacity. In order to meet this requirement, the public water system shall submit documentation to demonstrate Demonstration of technical capacity must include the following: (3-24-22)(______)
- a. The <u>system PWS</u> meets the relevant design, construction, and operating requirements of these rules;
 - b. The system PWS has an adequate and consistent source of water; (3-24-22)(
 - **c.** A plan is in place to protect the water source and deal with emergencies;
 - **d.** A plan exists for replacement or improvement of infrastructure as necessary; and
- e. The <u>system PWS</u> has trained personnel with an understanding of the technical and operational characteristics of the <u>system PWS</u>.
- **02. Financial Capacity**. A dDemonstration of financial capacity must include but is not limited to the following information: (3-24-22)(_____)
- a. Documentation that organizational and financial arrangements are adequate to construct and operate the <u>public water system PWS</u> in accordance with these rules. This information can be provided by submitting estimated construction, operation, and maintenance costs, letters of credit, or other access to financial capital through public or private sources and, if available, a certified financial statement;

 (3-24-22)(_____)
- **b.** Demonstration of revenue sufficiency, that includes but is not limited to billing and collection procedures; a proposed rate structure which demonstrates the availability of operating funds, revenues for depreciation and reserves, and the ability to accrue a capital replacement fund. A preliminary operating budget shall must be provided; and (3 24 22)()
 - c. Adequate fiscal controls must be demonstrated. ()
- 03. Managerial Capacity. In order to demonstrate adequate Demonstration of managerial capacity, the owner or operator of a new drinking water system shall submit at least must include the following-information to the Department:

 (3-24-22)(_____)
- **a.** Clear documentation of legal ownership and any plans that may exist for transfer of that ownership upon completion of construction or after a period of operation;

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

- **b.** The name, address, and telephone number of the person who will be accountable for ensuring that the <u>water system PWS</u> is in compliance with these rules; (3 24 22)(____)
 - **c.** The name, address, and telephone number of the responsible charge operator; ()
- **d.** A description of the manner in which the <u>water system PWS</u> will be managed. Information such as by-laws, restrictive covenants, articles of incorporation, or procedures and policy manuals which describe the management organizational structure <u>shall must</u> be provided; (3.24.22)(1.21)
- **e.** A recommendation of staff qualifications, including training, experience, certification or licensing, and continuing education;
- **f.** An explanation of how the <u>water system PWS</u> will establish and maintain effective communications and relationships between the <u>water system PWS</u> management, its customers, professional service providers, and any applicable regulatory agencies; and (3-24-22)(_____)
- **g.** Evidence of planning for future growth, equipment repair and maintenance, and long term replacement of system components.
- **Submittal-Form.** The Department shall provide a standard form to be used in preparing a new system capacity demonstration. The submittal form and general The PWS owner may request guidance on how to prepare a new system capacity document is provided in, "How to Demonstrate Financial, Technical, and Managerial Capacity in New Public Water Systems." This document may be requested submittal from the Department, and the guidance is available on the DEQ partment website at http://www.deq.idaho.gov.
- **O5. Expanding Systems**. A <u>public water system PWS</u> which comes into existence as a result of growth in population or number of service connections within a previously unregulated system will be considered a new <u>system PWS</u> under these rules and is subject to all design, construction, and operating requirements herein.

(3.24.22)(

- **PWS** must investigate the feasibility of obtaining water service from an established public water system PWS. If such service is available, but the owner elects to proceed with an independent system PWS, the owner must explain why this choice is in the public interest in terms of environmental protection, affordability to water users, and protection of public health.
- **O7. Exclusion**. New-public water systems PWSs which are public utilities as defined in Sections 61-104 (Corporation), 61-124 (Water System), 61-125 (Water Corporation), and 61-129 (Public Utility), Idaho Code, must meet the regulatory requirements of the Idaho Public Utilities Commission (IPUC) in Chapter 1, Title 61, Idaho Code, Public Utilities Law, and IDAPA 31.01.01, "Rules of Procedure of the Idaho Public Utilities Commission." Such water systems will not be required to meet any requirements of this Section which are in conflict with the provisions and requirements of the IPUC.

501. FACILITY AND DESIGN STANDARDS: GENERAL DESIGN REQUIREMENTS FOR PUBLIC DRINKING WATER SYSTEMS.

Unless otherwise specified by the Department, the design of new-drinking water systems PWSs, or modifications to existing, public drinking water systems, shall be in conformance with PWSs must conform to the facility and design standards set forth in 40 CFR 141.5, and Sections 006 and 500 through 552 of these rules. The following general design requirements shall apply as applicable for the type of water system PWS and the treatment or other processes employed.

Materials Used in Construction. Products that are used to construct public drinking water systems PWSs and have water contact surfaces shall must conform to applicable AWWA standards and be certified by an accredited ANSI certification body to meet applicable ANSI/NSF standards, where products meeting such AWWA and ANSI/NSF standards exist, and must conform to 40 CFR 143 Subpart B. In the absence of such products, products meeting applicable product standards and acceptable to the reviewing authority Department may be selected. Corrosion control shall must be taken into account during all aspects of public water system PWS design.

Electrical. Main switch gear electrical controls-shall must be located above grade, in areas not subject to flooding. All electrical work-shall must conform to the requirements of the National Electrical Code or to relevant state/local codes. The National Electrical Code is available from the National Fire Protection Association, 1 Batterymarch Park, Quincy, Massachusetts 02169-7471, (617)770-3000, http://www.nfpa.org.

Separate room(s) for chemical storage and feed equipment that may be required based on type of

chemicals and associated hazards.

f.

07. Reliability and Emergency Operation. New community water systems constructed after April
15, 2007 PWSs are required to have sufficient dedicated on-site standby power, with automatic switch-over
capability, or standby storage so that water may be treated and supplied to pressurize the entire distribution system
during power outages. During a power outage, the water system shall PWS must be able to meet the operating
pressure requirements of Subsection 552.01.b. for a minimum of eight (8) hours at average day demand plus fire flow
where provided. A minimum of eight (8) hours of fuel storage- shall must be located on site unless an equivalent plar
is authorized by the Department. Standby power provided in a -public drinking water system shall <u>PWS may</u> be
coordinated with the standby power that is provided in the wastewater collection and treatment system.

(3-24-22)(_____

- **a.** The Department may require the installation of standby power or storage facilities in existing systems <u>PWSs</u> if the frequency and duration of power outages a system <u>PWS</u> experiences constitute a health hazard.
- **b.** Existing community—<u>public water systems PWSs</u> that are <u>substantially modified after April 15, 2007 shall undergoing material modifications must</u> meet the requirements of Subsection 501.07. in those portions of the <u>system PWS</u> affected by the modifications.

 (3-24-22)(____)
- c. New sources and booster pumps intended to increase <u>system PWS</u> capacity <u>shall must</u> be provided with standby power or equivalent unless, during a power outage, the <u>public water system PWS</u> or distribution system pressure zone can already meet the minimum operating capacity and pressure requirements in Subsection 501.07 for a minimum of eight (8) hours at average day demand plus fire flow where provided for each pressure zone.

(3-24-22)(

- **d.** For both new and existing <u>public water systems PWSs</u>, the Department may reduce the requirements of Subsection 501.07 if the <u>system PWS</u> can demonstrate the capacity to adequately protect public health during a power outage. Any decision by the Department will be based on, but not limited to, the following considerations:
 - i. An adequate emergency response and operation plan and the capacity to implement that plan.
- ii. The adequacy of the <u>system's PWS's</u> cross connection control program and the capacity to protect public health in the event of a system wide depressurization.
- iii. Demonstration of historical and projected reliability of the electrical power supplied to the water (3 24 22)(_____)
- iv. A strategy for providing information to the public during power outages, including instructions to stop irrigation, boil water, etc., until notified otherwise.
- v. The level of reliability acceptable to consumers. This can be accomplished with either a vote of the majority of consumers for privately owned and operated <u>systems PWSs</u> or a decision by the governing body for publicly governed <u>systems PWSs</u>.
- vi. Other considerations that may be pertinent, including connections to other public water systems PWSs, agreements to provide water in emergency situations, and the availability of dedicated portable auxiliary power.
- **08. On-Site Analysis and Testing Capabilities**. Each <u>public water system shall PWS must</u> have equipment and facilities for routine testing necessary to ensure proper operation. Equipment selection <u>shall must</u> be based on the characteristics of the raw water source and the complexity of the treatment process involved.
 - (3-24-22)(_____)
- **09.** Sample Taps. Sample taps shall must be provided so that water samples can be obtained from each water source and from appropriate locations in each unit operation of treatment, and from the finished water. Taps

shall must be consistent with sampling needs and shall not be of the petcock type. Taps owned by the water system PWS and used for obtaining samples for bacteriological analysis—shall must be of the smooth-nosed type without interior or exterior threads,—shall will not be of the mixing type, and—shall will not have a screen, aerator, or other such appurtenance.

(3-24-22)(_____)

- 10. Facility Potable Water Supply. The facility water supply service line and the plant finished water sample tap shall_must be supplied from a source of finished water at a point where all chemicals have been thoroughly mixed, and the required disinfectant contact time, if applicable, has been achieved. There-shall_may be no cross connections between the facility water supply service line and any piping, troughs, tanks, or other treatment units containing wastewater, treatment chemicals, raw or partially treated water.
- 11. Meters. All water supplies—shall must have an acceptable means of measuring the flow from each source, the wash water, the recycled water, any blended water of different quality, and the finished water.

(3-24-22)(

- 12. Operation and Maintenance Manual. A new or updated operation and maintenance manual that addresses all—water system PWS facilities—shall must be submitted to the Department for review and approval prior to start-up of the new or materially modified—public water system PWS unless the same system components are already covered in an existing operation and maintenance manual. For existing—systems PWSs with continual operational problems as determined by the Department, the Department may require that an operation and maintenance manual be submitted to the Department for review and approval. The operator—shall will ensure that the system PWS is operated in accordance with the approved operation and maintenance manual.
- 13. Start-Up Training. Provisions shall must be made for operator instruction at the start-up of a new plant or pumping station.
- 14. Safety. Consideration shall must be given to the protection of maintenance personnel and visitors from typical and foreseeable hazards in accordance with the engineering standards of care. The design-shall must comply with all applicable safety codes and regulations that may include the Uniform Building Code, International Fire Code, National Fire Protection Association Standards, and state and federal OSHA standards. Items to be considered include, but are not limited to, noise arresters, noise protection, confined space entry, protective equipment and clothing, gas masks, safety showers and eye washes, handrails and guards, warning signs, smoke detectors, toxic gas detectors and fire extinguishers.
- **15. Security**. Appropriate design measures to help ensure the security of <u>water system PWS</u> facilities <u>shall must</u> be incorporated. Such measures, at a minimum, <u>shall will</u> include means to lock all exterior doorways, windows, gates and other entrances to source, treatment, pumping stations, and water storage facilities.

(3 24 22)()

- **16. Other Regulations**. Consideration must be given to the design requirements of other federal, state, and local regulatory agencies for items such as safety requirements, special designs for the handicapped, plumbing and electrical codes, and construction in the flood plain.

18. Redundant Fire Flow Capacity.

()

a. Public water systems PWSs that provide fire flow-shall must be designed to provide maximum day demand plus fire flow. Fire flow requirements and system adequacy-shall will be determined by the local fire authority or by a hydraulic analysis by a licensed professional engineer to establish required fire flows in accordance with the International Fire Code as adopted by the State Fire Marshal. Pumping systems supporting fire flow capacity must be designed so that maximum day demand plus fire flow may be provided with any pump out of service.

(3-24-22)(____

- **b.** The requirement for redundant pumping capacity specified in Subsection 501.18.a. may be reduced to the extent that fire suppression storage is provided in sufficient quantity to meet some or all of fire flow demands. Where fire suppression storage is not provided, the requirement for fire flow pumping redundancy may be reduced or eliminated if the following conditions are met:
- i. The local fire authority justifies that the fire flow capacity of the <u>system PWS</u> is acceptable and is compatible with the water demand of existing and planned fire-fighting equipment and fire-fighting practices in the area served by the <u>system PWS</u>.
- ii. In a manner appropriate to the <u>system PWS</u> type and situation, notification is provided to customers that describes the design of the <u>system's PWS's</u> fire-fighting capability and explains how it differs from the requirements of Subsection 501.18.a. (3-24-22)(_____)
- 19. Pilot Studies. Unless otherwise approved by the Department based on documentation provided by the design engineer, pilot studies are required for treatment processes other than chlorine disinfection or point of use installations. Pilot studies may be performed in the field using the proposed source water or in conjunction with bench scale testing in the lab using the proposed source water. The system shall PWS must obtain the Department's approval of a pilot study plan before the pilot study is implemented. A pilot study shall will be conducted for a period that shall be is determined by the design engineer and approved by the Department. A final pilot study report with results shall must be submitted to the Department for review and approval. Upon completion of the pilot study, final approval of equipment and treatment processes is subject to the applicable requirements of Sections 500 through 552.
- **a.** Pilot Study Plan. A pilot study plan-shall must include the following and any other items required by the Department: (3-24-22)(_____)
- i. <u>Introduction and Background. The plan shall discuss gG</u>eneral information about the project including the existing system, the reason for conducting the pilot study, and anticipated results of a successful pilot study.
- ii. Alternative Processes. Provide a processes that eould may be used if the proposed process is shown to be ineffective from the study.
- iii. Procedures and Methods. The procedures and methods section shall discuss Discussion of how the pilot study will be conducted, the time frame of the study, source water quality, how source water may be altered to mimic various source water quality conditions, and the water quality parameters that are monitored and evaluated to determine if the treatment process was effective.

 (3-24-22)(_____)
- **b.** Pilot Study Report. The pilot study report—shall must include the following and any other items required by the Department: (3-24-22)(_____)
 - i. Introduction and Background. ()
- ii. Results. A discussion of the overall pilot study progress, including any issues or problems and a general discussion of results of the study and what the results indicate. This discussion—should will determine parameters necessary for full scale implementation.
- iii. Conclusions. Conclusions and recommendation to proceed with the treatment process if the results of the study proved successful.
- **c.** Additional specific pilot study requirements in Sections 500 through 552-shall <u>must</u> be included in pilot study plans and reports. (3-24-22)(_____)
- **d.** Engineer's Seal Required. Pilot study plans and pilot study reports submitted to the Department shall must bear the imprint of an Idaho licensed professional engineer's seal that is both signed and dated by the

Facility Plan Contents. The facility plan-shall must include basic information, criteria and

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

assumptions, and hydraulic capacity, treatment capacity, standby power, redundancy, fire flows, project financing, operation and maintenance considerations, alternative solutions with preliminary layouts, and cost estimates as applicable. The facility plan is intended to address system wide growth, to identify system deficiencies, and to lay out a plan for system upgrades and expansion. If specific items listed in Subsections 502.04.a.i. through 502.04.a.viii. or Subsections 502.04.b.i. through 502.04.b.vii. are not applicable to a particular facility plan, then the submitting engineer must state this in the facility plan and state the reason why the requirement is not applicable.

(3-24-22)()

- a. New public water system facility plan. The minimum requirements for a facility plan for a new public water system PWS are listed in Subsections 502.04.a.i. through 502.04.a.viii. If specific items listed in Subsections 502.04.a.i. through 502.04.a.viii. are not applicable to a particular system, then the submitting engineer shall state this in the facility plan and state the reason why the requirement is not applicable. The facility plan must also include sufficient detail to support applicable requirements of Sections 501 through 552. but it must include:

 (3.24.22)
 - i. Location. A general description and location of the system PWS. (3-24-22)(
- ii. Population. The estimated design population of the system PWS including the number of connections and the number of EDUs proposed.
- iii. Sources of Water. Adequacy, quality, and availability of sources of water for potable use and a description of the non-potable irrigation system.
 - iv. Treatment. Identify and describe any anticipated treatment. (3-24-22)(
- v. Water Quantity. Design data covering water quantity for domestic, irrigation, fire fighting, commercial, or industrial water uses, including peak hour, maximum day, and average day demands.
 - $\frac{(3-24-22)}{(3-24-22)}$
 - vi. Storage. Include the size and location of any anticipated storage structures. (3-24-22)(
 - vii. Operating Pressure. Pressure ranges for all flow conditions prescribed by these rules.

(3-24-22)()

- viii. <u>Sewage.</u> Describe the <u>sewage wastewater</u> collection system and <u>sewage wastewater</u> treatment works, with reference to their relationship to existing or proposed water works structures which may affect the operation of the water supply system, or which may affect the quality of the supply. (3-24-22)(____)
- **b.** Existing public water system facility plan. The minimum requirements for a facility plan for an existing public water system PWS must include Subsections 502.04.b.i. through 502.04.b.vii. as well as Subsections 502.04.a.i. through 502.04.a.viii. If specific items listed in Subsections 502.04.b.i. through 502.04.b.vii. or Subsections 502.04.a.i. through 502.04.a.viii. are not applicable to a particular facility plan, then the submitting engineer shall state this in the facility plan and state the reason why the requirement is not applicable. The facility plan must also include sufficient detail to support applicable requirements of Sections 501 through 552.

 $\frac{(3-24-22)}{(3-24-22)}$

i. <u>Hydraulic analysis.</u> A computer<u>ized hydraulicanalysis of the hydraulics model</u> of the distribution system if requested based on flow demand and pressure requirements is required unless otherwise approved by the Department; any analysis hydraulic model of an existing distribution system—shall must be properly calibrated. The type or sophistication of analysis shall hydraulic model will be dependent on the type of system PWS.

(3-24-22)(____

- ii. Identify and evaluate problems related to the drinking water system PWS. (3.24.22)(
- iii. Describe financing methods. ()
- iv. Set forth anticipated charges for users. ()

- i. Intake structures. Describe the intake structures that will be used. (3-24-22)
- ii. Off-stream raw water storage. If applicable, describe the proposed off-stream raw water storage.
- iii. Treatment methods. Describe the treatment methods and potential alternatives including the removal of pathogens, disinfection, enhanced disinfection, water quality monitoring, and redundancy provisions.
- iv. Treatment Wastes. Characterize the various wastes from the water treatment processes and, if applicable, their volumes, constituents, and proposed treatment and disposal. If discharging to a sanitary sewage system, verify that the system is capable of handling the flow to the treatment works and that the treatment works is capable and willing to accept the additional loading.

 (3-24-22)(_____)
- v. Monitoring Results. Provide applicable raw water monitoring results as required by these rules including anticipated turbidity ranges, microbiological, physical, chemical, radiological, and other parameters as determined by the Department.
- vi. Potential contamination. An assessment of the degree of hazard to the supply by agricultural, industrial, recreational, and residential activities in the watershed, and by accidental spillage of materials that may be toxic, harmful or detrimental to treatment processes.
- vii. Waste discharge. Assess all waste discharges and activities that could may impact the water supply. The location of each waste discharge shall must be shown on a scale map.
- viii. Hydrological and historical stream flow data. Provide any available records and data regarding hydrological and historical stream flow.
- ix. Water rights and water quantity. A copy of the appropriate permit(s) or application(s) from the Idaho Department of Water Resources regarding authorization to appropriate public waters of the state of Idaho in sufficient quantity to meet the design requirements of the system PWS. (3-24-22)(____)
 - x. Turbidity. Anticipated turbidity range.
- xi. Watershed. Assessment of the degree of control the water system PWS will be able to exercise over the watershed.
 - xii. Projected future uses of impoundments or reservoirs within the watershed. (3.24.22)(
- xiii. Water quality. Submit source water sample data over a sufficient period of time to assess the microbiological, physical, chemical and radiological characteristics of the water.
- xiv. Stream characteristics. Provide consideration of currents, wind and ice conditions, and the effect of confluent streams.

504. FACILITY AND DESIGN STANDARDS: REVIEW OF PLANS AND SPECIFICATIONS.

The <u>Department will apply the</u> facility and design standards set forth in these rules <u>shall be applied</u>, <u>Subsections 500</u> through 548, in the review of plans and specifications for <u>public water system PWS</u> facilities. If design issues are not addressed by the facility and design standards set out in these rules, then guidance documents, some of which are listed in Subsection 002.02, <u>shall must</u> be used as guidance in the design and review of plans and specifications for public drinking water facilities. See also Section 013.

01. Ownership. DThe PWS owner must provide documentation of the ownership and responsibility for operating the proposed system shall be made available PWS to the Department prior to or concurrent with the

Page 695

24-22)(

submittal of plans and specifications as required in Subsection 504.03. The documentation must show organization and financial arrangements adequate to assure construction, operation and maintenance of the system PWS according to these rules. Documentation-shall also includes the name of the water system PWS, the name, address, and phone number of the supplier of water, the system PWS size, and the name, address, and phone number of the system PWS operator. This information may be presented in a will serve letter as required in Subsection 504.02.

(3-24-22)

Connection to an Existing System Will Serve Letter. If the proposed project is to be connected to an existing public water system PWS, a letter from the purveyor must be submitted to the Department stating that the purveyor will be able to provide services to the proposed project and that purveyor has reviewed and accepted the proposed construction plans and specifications. The Department may require documentation supporting the ability of the purveyor to provide service to the new system without diminishing quality of service to existing customers, as described in Subsection 502.01.a and 502.01.b. This letter must be submitted prior to or concurrent with the submittal of plans and specifications as required in Subsection 504.03.

03. Plans and Specifications Required.

Prior to construction of new-public drinking water systems, new drinking water systems designed

)

- to serve fifteen (15) or more service connections, <u>PWSs</u> or material modifications of existing <u>public</u> water systems <u>PWSs</u>, the owner <u>must submit</u> plans and specifications must be submitted to the Department for review and approval. Construction should must commence as soon as practical after approval, and if construction is not completed within twelve (12) months of the Department's final approval, an extension or re-approval must be obtained from the Department. The Department may require re-submittal of all or part of the plans and specifications prior to issuing an extension or re-approving the plans and specifications.
- Plans and specifications for simple water main extensions—shall do not require pre-construction approval by the Department when such extensions will be owned and operated by a city, county, quasi-municipal corporation or regulated public utility, provided that such plans and specifications are reviewed and approved by a QLPE who was not involved in the preparation of the plans and specifications being reviewed to verify compliance with the requirements of these rules prior to initiation of construction. Any plans and specifications approved pursuant to Subsection 504.03.b. shall must be transmitted to the Department at the time construction is authorized and shall will be marked or stamped as "Approved for Construction." Along with the plans and specifications, the transmittal must include the items listed in Subsections 504.03.b.i. through 504.03.b.vii. The plans and specifications must bear the imprint of an Idaho licensed professional engineer's seal that is both signed and dated by the engineer, and the approval or transmittal letter must be sealed, signed, and dated by the QLPE that is approving the plans and specifications.
- A statement that the author of the transmittal letter is the QLPE representing the city, county, quasimunicipal corporation or regulated public entity.
- A statement that the extension project complies with the current facility plan or preliminary engineering report PER, or a statement that the water system PWS has adequate capacity. Please see Subsection 502.01.b. for further information.
- A statement from the city, county, quasi-municipal corporation or regulated public entity or its authorized agent that the water system PWS purveyor will serve the project.
- A statement from the city, county, quasi-municipal corporation or regulated public entity or its authorized agent that the water system PWS purveyor will own and operate the project after construction is complete.
 - V. A statement by the QLPE that the plans and specifications are approved for construction.
- A statement by the QLPE that the plans and specifications comply with the facility standards within vi. these rules.
 - vii. A statement recommending whether sanitary restrictions can be released or should will remain in

force. (3-24-22)(____)

- **c.** Subsections 504.03.c.i. through 504.03.c.vi. outline the projects which QLPEs may approve and which QLPEs may not approve.
- i. A QLPE may approve plans and specifications for simple water main extensions that are able to connect to an existing water system PWS owned by a city, county, quasi-municipal corporation, or regulated public utility at the time the extension is approved for construction by the QLPE.
- ii. A QLPE may approve plans for simple water main extensions which will connect to an existing water system <u>PWS</u>, but are unable to connect to the <u>system PWS</u> at the time the extension is approved for construction by the QLPE, provided sanitary restrictions remain in force for the proposed extension. (3-24-22)(
- iii. A QLPE may not approve plans and specifications which include mechanical systems such as booster stations.
- iv. A QLPE may not approve plans and specifications for projects which the QLPE was the design engineer or otherwise involved in the design.
- v. A QLPE employed by a city, county, quasi-municipal corporation, or regulated public utility may approve a design that was prepared by a subordinate engineer or an engineer from a separate design group within the city, county, quasi-municipal corporation, or regulated public utility.
- vi. A QLPE who is not employed by a city, county, quasi-municipal corporation, or regulated public utility, but is retained by a city, county, quasi-municipal corporation, or regulated public utility for the purpose of plan and specification review may not approve projects designed by the company with which the QLPE is employed.
- **d.** At the discretion of the city, county, quasi-municipal corporation or regulated public utility, the plans addressed by Subsection 504.03.b. may be referred to the Department for review and approval prior to initiation of construction.
- **04.** Criteria for Review Criteria. The Department shall will review plans and specifications to determine compliance with these rules and engineering standards of care. If the plans and specifications comply with these rules and engineering standards of care, the Department shall will not substitute its judgment for that of the owner's design engineer concerning the manner of compliance with the rule.
- of the Department and applicant have not resolved design issues within forty-two (42) calendar days of submittal such that approval can be granted. If the Department and applicant have not resolved design issues within forty-two (42) calendar days or at any time thereafter, the applicant may file a written demand to the Department for a decision. Upon receipt of such written demand, the Department shall deliver a written decision to the applicant within no more than seven (7) calendar days explaining any reasons for disapproval. The Department shall maintain records of all written demands for decision made pursuant to Subsection 504.05 with such records including the final decision rendered and the timeliness thereof in accordance with timelines set forth in Section 39-118, Idaho Code.
- **106. Engineer's Seal Required.** Plans and specifications submitted to the Department—shall must bear the imprint of an Idaho licensed professional engineer's seal; except that the Department will accept the seal of an Idaho licensed professional geologist on the following:

 (3-24-22)(____)
- **a.** Well source, spring source, or infiltration gallery site evaluation reports, as specified in Subsections 510 and 514.
- ${f b.}$ Plans and specifications for well construction and results of field inspection and testing, as specified in Section 510.
 - **O7.** Contents of Plans and Specifications. Plans and specifications—shall must, where pertinent,

chemical facilities, waste disposal wells, and agricultural uses within five hundred (500) feet of the well site.

 $\frac{(3 \cdot 24 \cdot 22)}{(3 \cdot 24 \cdot 22)}$

O2. Location. Each well shall be staked by the design engineer or licensed professional geologist prior to drilling, be located a minimum of fifty (50) feet from the nearest property line, be located a minimum of fifty (50) feet from any potential source of contamination, and be no closer to specified sources of contamination than set forth in Subsection 900.01. In vulnerable settings, the Department may require engineering or hydrologic analysis to determine if the required setback distance is adequate to prevent contamination. Each well must be staked by the design engineer or licensed professional geologist prior to drilling and meet the following minimum distances:

Minimum Distances from a Public Water System Well		
Frost free hydrant	<u>5 feet</u>	
Property line	<u>50 feet</u>	
Gravity wastewater line	<u>50 feet</u>	
Any potential source of contamination	50 feet	
Pressure wastewater line	<u>100 feet</u>	
Class A Municipal Reclaimed Wastewater Pressure distribution line	<u>50 feet</u>	
Individual home septic tank	<u>100 feet</u>	
Individual home disposal field	<u>100 feet</u>	
Individual home seepage <u>pit</u>	<u>100 feet</u>	
<u>Privies</u>	<u>100 feet</u>	
<u>Livestock</u>	<u>50 feet</u>	
Drainfield - standard subsurface disposal module	<u>100 feet</u>	
Absorption module - large soil absorption system	150 - 300 feet, see IDAPA 58.01.03	
Canals, streams, ditches, lakes, ponds and tanks used to store non-potable substances	<u>50 feet</u>	
Storm water facilities disposing storm water originating off the well lot	<u>50 feet</u>	

Minimum Distances from a Public Water System Well					
Municipal or industrial wastewater treatment plant	<u>500 feet</u>				
Reclamation and reuse of municipal and industrial wastewater sites	See IDAPA 58.01.17				
Biosolids application site	<u>1,000 feet</u>				

(3-24-22)(

- **O3.** Construction Standards. In addition to meeting the requirements of these rules, all wells—shall must be constructed in accordance with IDAPA 37.03.09, "Well Construction Standards Rules," and related rules and laws administered by the Idaho Department of Water Resources. All wells—shall must comply with the drilling permit requirements of Section 42-235, Idaho Code.

 (3 24 22)(____)
- a. Casing that meets the requirements set forth in Subsection 900.02 (Table 2). The use of plastic well casing for public water system wells may be considered on a case by case basis. Plastic casing shall meet or exceed ASTM Standard F480-02 and ANSI/NSF Standard 61. Casing for steel pipe must meet the following requirements:

STEEL PIPE							
<u>DIAMETER</u> (inches)			THICKNESS (inches)	<u>WEIGHT PER FOOT</u> (pounds)			
<u>SIZE</u>	<u>External</u>	<u>Internal</u>		Plain Ends (calculated)	With Threads and Couplings (nominal)		
<u>6(id)</u>	<u>6.625</u>	<u>6.065</u>	<u>0.280</u>	<u>18.97</u>	<u>19.18</u>

(3 24 22)(

- **b.** The use of plastic well casing for PWS wells may be considered on a case-by-case basis. Plastic casing must meet or exceed ASTM Standard F480, current edition, and ANSI/NSF Standard 61. Plastic casing must also meet the following requirements:
- <u>i.</u> <u>Have a minimum wall thickness equivalent to standard dimension ration 21. However, diameters of 8 inches or greater or deep wells may require greater thickness to meet collapse strength requirements; ()</u>
 - ii. Must not be used at sites where permeation by hydrocarbons or degradation may occur; (_____)
- iii. Must be assembled using coupling or solvent welded joints. All coupling and solvents must meet ANSI/NSF Standard 14, ASTM F480, or similar requirements; and
 - iv. Must not be driven.
- **bc.** Public water system PWS wells shall must have no less than fifty-eight (58) feet of annular seal of not less than one and one-half (1½) inches thickness as measured from land surface to the bottom of the seal unless: (3.24.22)()
- i. It can be demonstrated to the Department's satisfaction that there is a confining layer at lesser depth that is capable of preventing unwanted water from reaching the intake zone of the well; or
 - ii. The best and most practical aquifer at a particular site is less than fifty-eight (58) feet deep; or;
 - iii. The Department specifies a different annular seal depth based on local hydrologic conditions.
- iv. More stringent standards are required by applicable Rules of the Idaho Water Resources Board, referenced in Subsection 002.02. (3 24 22)
- ed. Specifications—shall must include allowable tolerances for plumbness and alignment in accordance with AWWA Standards, incorporated by reference into these rules at Subsection 002.01, or as otherwise approved by the Department. If the well fails to meet these requirements, it may be accepted by the Department if it does not interfere with the installation or operation of the pump or uniform placement of grout.

 (3-24-22)(_____)
- Geological data—shall must be collected at each pronounced change in formation and shall be recorded in the driller's log. Supplemental data includes, but is not limited to, accurate geographical location such as latitude and longitude or GIS coordinates, and other information on accurate records of drillhole diameters and depths, assembled order of size and length of casing, screens and liners, grouting depths, formations penetrated, and water levels.

<u>ef</u> .	The owner of each well-shall must retain all records pertaining to each well	ll until the well has beer
properly abandon	ed.	(3-24-22) (

fg. Wells with intake screens-shall <u>must</u>:

(3 24 22)(_____

- i. Be constructed of materials resistant to damage by chemical action of ground-water or cleaning operations.
 - ii. Have openings based on sieve analysis of formation, or gravel pack materials, or both.

(3 24 22)(

iii. Have sufficient length and diameter to provide adequate specific capacity and aperture entrance velocity not to exceed point three one (0.31) feet per second, or as otherwise approved by the Department.

(3-24-22)(

- iv. Be installed so that the pumping water level remains above the screen under all operating conditions, or otherwise approved by the Department. Where a bottom plate or sump is utilized, it-shall_must be of the same material as the screen, or as otherwise approved by the Department. Where a washdown assembly, tailpipe or sump is used below the screen, it may be made of a different material than the screen.

 (3 24 22)
- **gh.** Permanent well casing shall must be surrounded by a minimum of one and one-half (1½) inches of grout to the depth required by Subsection 510.03.b. of these rules, or by the Rules of the Idaho Water Resources Board referenced in Subsection 002.02 Idaho Department of Water Resources, whichever is greater. All casing identified in plans and specifications as temporary casing shall must be removed prior to well completion.

(3.24.22)(

- i. Neat cement grout consisting of cement that conforms to AWWA Standard A-100, and water, with not more than six (6) gallons of water per ninety-four (94) pounds of cement, shall must be used for one and one-half (1½) inch-openings annular space. Additives may be used to enhance effectiveness increase fluidity and are subject to approval by the reviewing authority Department and the Idaho Department of Water Resources on a case-by-case basis
- ii. Bentonite grout—shall_must have a solids content not less than twenty-five (25) percent by weight when mixed with water and be specifically manufactured for use in sealing of well casing. Bentonite grout shall not contain weighting agents to increase solids content. Bentonite grout—shall_must not be used above the water table. All bentonite grout—shall_must be installed by positive displacement from the bottom up through a tremmic or float shoe.

(3.24.22)(

- iii. Where a dry annular space is to be sealed, a minimum of two (2) inches on all sides of the casing shall will be required to place bentonite to depths not greater than one hundred (100) feet, using #8 mesh granular bentonite. All dry pour granular bentonite—shall must be tagged at appropriate intervals to verify placement. If a bridge occurs, a tremmie pipe—shall must be washed or jetted through the bridge to allow for pumping of grout. Bentonite chips—shall must be of sufficient size to accommodate proper placement for the existing subsurface conditions.
- iv. Dry granular bentonite used in wells where a dry annular space is to be sealed with depths greater than one hundred (100) feet-shall will require an annulus of at least three (3) inches on all sides of the casing, or as approved by the reviewing authority Department and the Idaho Department of Water Resources. If a bridge occurs, a tremmie pipe-shall must be washed or jetted through the bridge to allow for pumping of grout. Bentonite chips-shall must be of sufficient size to accommodate proper placement for the existing subsurface conditions. (3-24-22)(
- v. All chip bentonite seals installed through water-shall <u>must</u> only be used in annular spaces of at least four (4) inches on all sides of the casing. If a bridge occurs, a tremmie pipe <u>shall must</u> be washed or jetted through the bridge to allow for pumping of grout. Bentonite chips—<u>shall must</u> be of sufficient size to accommodate proper placement for the existing subsurface conditions. Chip bentonite seals installed through water-<u>shall must</u> be:

(3-24-22)(_____

	(1)	Installed in accordance with manufacturer's specifications; or	()

06.	Test Pumping.	Upon completion	of a ground-wate	er source, test	pumping shall	must be	conducte	d
in accordance wi	th the following	procedures to mee	et the specified red	quirements:		(3-24	22) ()

- a. The well-shall must be test pumped at the desired yield (design capacity) of the well for at least twenty-four (24) consecutive hours after the drawdown trend has stabilized, as determined by the supervising engineer or geologist. Alternatively, the well may be pumped at a rate of one hundred fifty percent (150%) of the desired yield for at least six (6) continuous hours after the drawdown trend has stabilized, as determined by the supervising engineer or geologist. The field pumping equipment must be capable of maintaining a constant rate of discharge during the test. Discharge water must be piped an adequate distance to prevent recharge of the well during the test. If the well fails the test protocol, design of the water system shall PWS must be re-evaluated and submitted to the Department for approval.
- **b.** Upon completion of well development, the well-shall must be tested for sand production. Fifteen (15) minutes after the start of the test pumping (at or above the design production rate), the sand content of a new well shall may not be more than five (5) parts per million. Sand production-shall must be measured by a centrifugal sand sampler or other means acceptable to the Department. If sand production exceeds five (5) ppm, the well-shall must be screened gravel packed, or re-developed.

 (3 24 22)()

c.	The following data-shall must be provided:	(3-24-22) ()

- i. Static water level in the well prior to test pumping and stabilized drawdown; (3-24-22)(
- ii. Well yield in gpm and duration of the pump test, including a discussion of any discrepancy between the desired yield and the yield observed during the test;
 - iii. Water level in the well recorded at regular intervals during pumping; ()
 - iv. Profile of water level recovery from the pumping level projected to the original static water level.
 - v. Depth at which the test pump was positioned in the well; ()
 - vi. Test pump capacity and head characteristics; ()
 - vii. Sand production data. ()
- viii. Results of analysis based on the drawdown and recovery test pertaining to aquifer properties, long term-sustained yield, and boundary conditions affecting drawdown.
- d. The Department may allow the use of other pump test protocols that are generally accepted by engineering firms with specialized experience in well construction, by the well drilling industry, or as described in national standards (such as ANSI/AWWA A100-97), as long as the minimum data specified in Subsection 510.06.c. are provided. The Department welcomes more extensive data about the well, such as step-drawdown evaluations used in determining well capacity for test pumping purposes, zone of influence calculations, and any other information that may be of use in source protection activities or in routine water system PWS operations.

 (3-24-22)(_____)
- **e.** Where aquifer yield, sustainability, or water quality are questionable, the Department, at its discretion, may require additional site—specific investigations that—could include test well construction, long-term pumping tests, or other means to demonstrate that the aquifer yield is sufficient to meet the long-term water requirements of the project.

 (3 24 22)(____)
- well constructed for use other than as a public water system PWS source may be considered for use as a public water system PWS source on a case-by-case basis. The owner of such a well must demonstrate to the Department's satisfaction that the well site conforms to the requirements of Subsections 510.01, 510.02, and Section 512, the well is constructed in a manner that is protective of public health, and that both the quantity and quality of water produced by the well meet public water system PWS standards set forth in these rules.

- **Observation Monitoring Wells.** If monitoring (observation) wells are used and are intended to remain in service after completion of the water supply well, the observation wells—shall must be constructed in accordance with the requirements for permanent wells and be protected at the upper terminal to preclude entrance of foreign materials in accordance with the "Well Construction Standard Rules," IDAPA 37.03.09. See Rules of the Idaho Water Resources Board referenced in Subsection 002.02.
- **O9.** Well Abandonment. Any water supply well that will no longer be used must be abandoned by sealing the borehole carefully to prevent pollution of the ground water, eliminate any physical hazard, conserve aquifer yield, maintain confined head conditions in artesian wells, and prevent mixing of waters from different aquifers. The objective of proper well abandonment procedures is to restore, as far as possible, the original hydrogeologic conditions. The services of a licensed well driller are required. Instructions for abandoning various types of wells may be obtained from the Idaho Department of Water Resources. See Rules of the Idaho Water Resources Board referenced in Subsection 002.02.Well decommissioning (abandonment) must be performed in accordance with Department of Water Resources requirements set forth in IDAPA 37.03.09, "Well Construction Standard Rules."

511. FACILITY AND DESIGN STANDARDS: WELL PUMPS, DISCHARGE PIPING, AND APPURTENANCES.

- **O1. Sample Tap Required.** A sample tap suitable for collecting bacteriological samples shall must be provided as required by Subsection 501.09 on the discharge piping from every well at a point where pressure is maintained but prior to any treatment. This sample tap shall be of the smooth nosed type without interior or exterior threads, shall not be of the mixing or petcock type, and shall not have a screen, aerator, or other such appurtenance. The sample tap for collecting bacteriological samples may be used for other sampling purposes. In addition, threaded hose bib taps may also be used for collecting samples, other than bacteriological samples, if equipped with an appropriate backflow prevention device as may be necessary to protect the public water system PWS from contamination.
- **O2. Discharge Piping.** The discharge line shall must be equipped with the necessary valves and appurtenances to allow a well to be pumped to waste at the design capacity of the scour velocity of the well column via an approved air gap of no less than two (2) pipe diameters, unless otherwise approved by the Department, through an approved non-corrodible screen at a location prior to the first service connection, and shall must meet the following requirements:

 (3-24-22)(_____)
 - a. Be designed to minimize friction loss. ()
- **b.** Have control valves and appurtenances located above the pump house floor when an above-ground discharge is provided.
 - c. Be protected against contamination. ()
- **d.** Vertical turbine pumps—<u>shall_must</u> be equipped with an air release-vacuum relief valve, or equivalent, located upstream from the check valve, with exhaust/relief piping terminating in a down-turned position at least eighteen (18) inches above the floor and covered with a twenty-four (24) mesh corrosion resistant screen.

(3-24-22)(____)

- e. Have all exposed piping, valves and appurtenances protected against physical damage and freezing.
- **f.** Be properly anchored to prevent movement, and protected against surge or water hammer. ()
- g. The pump to waste discharge piping—shall must be valved to ensure that other—system PWS components that could may be negatively affected by the quality of the discharged water are not pressurized by the water that is being pumped to waste.
 - **h.** Where two (2) or more wells are connected to a common well house, the discharge piping-shall

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

must be designed to ensure that each well can be pumped to waste independently without affecting the ability of the other well or wells to pressurize the system PWS. (3-24-22)(_____)

- **O3.** Pressure Gauge Required. A pressure gauge shall must be provided on all discharge piping.
- **O4.** Flow Meter and Check Valve. Unless otherwise approved by the Department—based—on documentation provided by the design engineer, an instantaneous and totalizing flow meter equipped with nonvolatile memory—shall must be installed on the discharge line of each well in accordance with the manufacturer's specifications. Meters installed on—systems_PWSs with variable frequency drives—shall must be capable of accurately reading the full range of flow rates. An accessible check valve, which is not located in the pump column,—shall must be installed in the discharge line of each well between the pump and the shut-off valve. Additional check valves—shall must be located in the pump column as necessary.
- **05. Well Vent**. All wells shall must be vented, unless it can be demonstrated that the drawdown under maximum pumping conditions will not exceed ten (10) feet.
- **a.** For wells not in a pump house, the open end of the vent shall must be screened with a twenty-four (24) mesh or similar non-corrodible screen and terminated downward at least eighteen (18) inches above the final ground surface.
- **b.** If the well is in a pump house, the open end of the vent-shall must be screened with a twenty-four (24) mesh or similar non-corrodible screen and must terminate downward at least twelve (12) inches above the pump house floor.
- **c.** Artesian wells equipped with pumps may need venting or an air valve as determined by the Department.
- **06.** Casings and Sanitary Well Caps. The following requirements apply to well casings and sanitary caps:
- a. Casings shall must extend at least eighteen (18) inches above the final ground surface. If the well is located within a pump house, casings shall must extend least twelve (12) inches above the pump house floor. For a well located in an area subject to flooding, the Department may require an extension of the casing above the one hundred (100) year or highest known flood level, whichever is higher.
- **b.** Wells-shall must be cased and provided with an approved cap in such a manner that surface water contamination cannot enter the well.
- **07. Well Houses.** For regulatory purposes, a well house is considered a pump house as defined in Section 003. Well houses must meet the requirements for pump houses as set forth in Section 541. All above ground discharge piping shall must be contained in a well house or otherwise protected from freezing.
 - 08. Pitless Adapters and Units. Pitless adapters or pitless units:

(3-24-22)(___

- a. Shall be of the type mMarked approved by the National Sanitation Foundation or Pitless Adapter Division of the Water Systems Council.
- **b.** Shall be dDesigned, constructed and installed to be watertight including the cap, cover, casing extension and other attachments.

- c. Shall be fField tested for leaks before being put into service. The procedure outlined in "Manual of Individual and Non-Public Water Supply Systems," referenced in Subsection 002.02, or other procedure approved by the Department-shall Must be followed.

 (3-24-22)(_____)
- d. Pitless adapters with a two (2) inch or smaller discharge line shall be pIf the discharge line is two (2) inches or smaller, be provided with a swing joint outside the pitless adapter unit to reduce strain, deformation, and possible leakage of the pitless seal caused by settling soils in the trench. The orientation of swing joints shall must be such that any settling that occurs will tighten the threads. The hole in the casing shall must be cut with a saw rather than a torch with an opening large enough to allow seating of gaskets.
 - e. Shall be pProvided with a contamination-proof entrance connection for electrical cable.

(3-24-22)(

f. In the case of pPitless adapters:

3-24-22)(

- i. Threaded adapters—shall <u>must</u> be installed by drilling a hole not more than one quarter (1/4) inch larger than the outer diameter of the pitless shank. No torch-cut holes—shall <u>will</u> be accepted. The orientation of swing joints—shall <u>must</u> be such that any settling that occurs will tighten the threads.
 - ii. The only field welding permitted will be that needed to connect a pitless adapter to the casing.

)

g. <u>In the case of pPitless units must be:</u>

(3-24-22)(___

- i. Shall be sShop-fabricated from the point of connection with the well casing to the unit cap or cover. $\frac{(3-24-22)}{(3-24-22)}$
- ii. Shall be c onstructed of materials and weight at least equivalent to and compatible with the well casing.
- iii. Shall be tThreaded or welded to the well casing. Threaded units shall must be installed by drilling a hole not more than one quarter (1/4) inch larger than the outer diameter of the pitless shank. No torch-cut holes-shall will be accepted. If the connection to the casing is by field weld, the shop-assembled unit must be designed specifically for field welding to the casing.
- iv. Shall tTerminate at least eighteen (18) inches above final ground elevation or three (3) feet above the 100 year flood level or the highest known flood elevation, whichever is higher, or as otherwise approved by the Department. For a well located in an area subject to flooding, the Department may require an extension of the casing above the one hundred (100) year or highest known flood level, whichever is higher.
 - v. Shall be pProvided with access to disinfect the well.

(3-24-22)(___

- vi. Shall have fField connection ed to the lateral discharge from the pitless unit of threaded, flanged, or mechanical joint connection.
- **h.** After installation of a pitless adapter or unit, the disturbed well seal—shall must be repaired or replaced to meet original seal specifications unless otherwise proposed by the design engineer and approved by the Department. The engineering proposal—shall must ensure that the material surrounding the final seal is moisture controlled and compacted such that it equals or exceeds the characteristics of the native soil prior to being disturbed.
- **Wells Not Allowed in Pits.** Wells shall <u>must</u> not be located in pits. Exceptions to this requirement will be granted by the Department if the well was constructed prior to November 5, 1964, and the installation is constructed or reconstructed in accordance with the requirements of the Department to provide watertight construction of pit walls and floors, floor drains and acceptable pit covers.

 (3 24 22)

A spill containment structure shall surround all fuel tanks and be sized to contain at least one

- **O3.** Location of Hydrants. Hydrants of the frost free type shall be placed in the buried piping system at a minimum of five (5) feet away from the well casing to prevent drain water from accumulating and compromising the grout seal surrounding the well casing.

 (3-24-22)
- **043. Parking Lots and Vehicle Storage**. No public parking or vehicle storage-shall may be allowed on the well lot, except that operation/maintenance vehicles may be temporary parked on the well lot during the normal course of business.

513. **FACILITY AND DESIGN STANDARDS:** NUMBER OF GROUND—WATER SOURCES REQUIRED – EXISTING SYSTEMS.

Existing community-water systems PWSs served by ground-water and intending to serve more than twenty-five (25) connections or equivalent dwelling units are subject to the following requirements for the number of ground-water sources required.

- **O1.** Existing System with All Sources Constructed Prior to July 1, 1985. A community—water system PWS served by ground-water and with all existing sources constructed prior to July 1, 1985 will be required to comply with Subsection 501.17 upon substantially modifying the system PWS after July 2002. (3 24 22)()
- **PWS** served by ground-water with any sources constructed after July 1, 1985. A community water system 501.17 when a modification is made to the system PWS which increases the population served or number of service connections, increases the length of transmission and distribution water mains, or increases the peak or average water demand.

 (3 24 22)(_____)

514. FACILITY AND DESIGN STANDARDS: SPRING SOURCES.

Written approval by the Department is required before water from any new or reconstructed spring source may be served to the public. For new spring sources, the Department—shall will require a site evaluation report containing applicable required information listed in Subsection 510.01. This information includes, but is not limited to, the following: an evaluation of the potability and quality of anticipated spring water; an estimate of hydrologic and geologic properties of the aquifer; and a description of potential sources of contamination within five hundred (500) feet of the spring. Any supplier of water for a public water system PWS served by one (1) or more springs—shall must ensure that the following requirements are met:

- **01. Protection of the Spring**. Springs shall must be housed in a permanent structure and protected from contamination including the entry of surface water, animals, and dust.
- **O2.** Spring Box or Combined Spring Box/Finished Water Storage Design. To facilitate efficient design and review of spring box or combined spring box/finished water storage designs, these site-specific designs should must be coordinated in advance with the Department. Specific issues to be addressed are: (3-24-22)(____)
- a. The inlet-shall must be screened as determined by the Department and located above the floor of the collection chamber.
- **b.** Unless otherwise approved by the Department based on documentation provided by the design engineer, the spring box or combined spring box/finished water storage tank-shall must meet the applicable design requirements of Section 544 Facility and Design Standards: General Design of Finished Water Storage.

(3 24 22)(____)

- **O3.** Sample Tap Required. A sample tap suitable for collecting bacteriological samples shall must be provided as required by Subsection 501.09. This sample tap shall be of the smooth nosed type without interior or exterior threads, shall not be of the mixing or petcock type, and shall not have a screen, aerator, or other such appurtenance. The sample tap for collecting bacteriological samples may be used for other sampling purposes. In addition, threaded hose bib taps may also be used for collecting samples, other than bacteriological samples, if equipped with an appropriate backflow prevention device as may be necessary to protect the public water system PWS from contamination.

 (3-24-22)(____)
 - **04.** Flow Measurement. A flow meter or other flow measuring device shall must be provided.

(3-24-22)(

05. Protected Area. The entire area within a one hundred (100) foot radius of the spring box and collection pipingshall must be owned by the supplier of water or controlled by a long term lease, fenced secured to prevent trespass of or livestock and void of buildings, dwellings and any potential sources of contamination. Surface water-shall must be diverted from this area. (3-24-22)(

515. FACILITY AND DESIGN STANDARDS: SURFACE SOURCES AND GROUND—WATER SOURCES UNDER THE DIRECT INFLUENCE OF SURFACE WATER.

Written approval by the Department is required before water from any new surface source or ground-water source that is under the direct influence of surface water may be served to the public. Infiltration collection lines or galleries

galleries	s that are infiltratio	round-water under the direct influence of surface water unless demonstrated other not directly influenced by surface water shall must meet the requirements of Section lines shall must be under the control of the water purveyor for a distance at	on 514. 076. Flocculation. Flocculation-shall mean is the gathering together of fine particles in water by gentle mixing after the addition of coagulant chemicals to form larger particles-and must include: (3-24-22)(_____)

Basin inlet and outlet design-shall must minimize short-circuiting and destruction of floc. A drain,

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

pumps, or a combination of both drain and pumps—shall must be provided to accomplish dewatering and sludge removal.

(3 24 22)(

- **b.** The flow-through velocity-shall must not be less than one-half (0.5) nor greater than one and one-half (1.5) feet per minute with a detention time for floc formation of at least thirty (30) minutes unless otherwise approved by the Department.
 - **c.** Agitators-shall <u>must</u> be driven by variable speed drives.
- (3-24-22)(____)
 sible. The velocity of
- **d.** Flocculation and sedimentation basins—shall must be as close together as possible. The velocity of flocculated water through pipes or conduits to settling basins—shall must be not less than one-half (0.5) nor greater than one and one-half (1.5) feet per second. Allowances must be made to minimize turbulence at bends and changes in direction.

 (3-24-22)(_____)
- **087. Small Systems May Use Baffling**. Baffling may be used to provide for flocculation in small treatment plants upon approval by the Department. (3-24-22)(_____)
 - **098. Sedimentation Units.** The following criteria apply to conventional sedimentation units: ()
- **a.** A minimum of two (2) hours of settling time-shall must be provided following flocculation unless adequate settling in less time can be demonstrated.
 - b. Inlets-shall <u>must</u> be designed to distribute the water equally and at uniform velocities.

(3-24-22)(____)

c. Outlet weirs or submerged orifices shall must maintain velocities suitable for settling in the basin and minimize short-circuiting. Outlet weirs shall must be designed so that the rate of flow over the outlet weirs or through the submerged orifices shall will not exceed twenty-thousand (20,000) gallons per day per foot of the outlet launder. The entrance velocity through the submerged orifices shall must not exceed one-half (0.5) feet per second.

(3.74.22)()

- **d.** The velocity through settling basins—shall must not exceed one-half (0.5) feet per minute. The basins must be designed to minimize short-circuiting. Fixed or adjustable baffles must be provided as necessary to achieve the maximum potential for clarification.

 (3-24-22)(_____)
- **e.** When an overflow weir or pipe is provided the overflow-shall must discharge by gravity with a free fall at a location where the discharge will be noted. (3-24-22)(_____)
- f. Adequate sludge collection equipment that ensures proper basin coverage shall must be provided and basins must be provided with a means for dewatering.
- g. Flushing lines or hydrants-shall <u>must</u> be provided and must be equipped with backflow prevention devices acceptable to the <u>Department under Section 543</u>.
- i. Sludge shall must be disposed of in accordance with applicable regulations, as set forth in Section 540.
- **1009. Solids Contact Clarifiers.** Solids contact clarifiers are generally acceptable for combined softening and clarification where water characteristics, especially temperature, do not fluctuate rapidly, flow rates are uniform and operation is continuous. A minimum of two (2) units are required for surface water treatment as required in Subsection 520.01.

- a. Chemicals shall <u>must</u> be applied at such points and by such means as to ensure satisfactory mixing of the chemicals with the water.
- **b.** Unless otherwise approved by the Department based on documentation provided by the design engineer, a rapid mix device or chamber ahead of the solids contact clarifier is required to assure proper mixing of the chemicals applied. Mixing devices employed-shall must be constructed so as to provide good mixing of the raw water with previously formed sludge particles and prevent deposition of solids in the mixing zone.

 (3-24-22)(_____)
- c. Flocculation equipment—shall <u>must</u> be adjustable as to speed, pitch, or a combination of speed and pitch and must provide for coagulation in a separate chamber or baffled zone within the unit.
- d. Sludge removal design—shall <u>must</u> provide that sludge pipes are not less than three (3) inches in diameter and arranged so as to facilitate cleaning. Entrance to sludge withdrawal piping—shall <u>must</u> be designed to prevent clogging. Provision—shall <u>must</u> be made for the operator to observe and sample sludge being withdrawn from the unit.
- **e.** Blow-off outlets and drains must terminate and discharge at places acceptable to the Department in regard to control of potential cross connections. Cross connection control must be included for the potable water lines used to backflush sludge lines.
- f. The detention time-shall must be established on the basis of the raw water characteristics and other local conditions that affect the operation of the unit. The Department may request data to support decisions made with respect to detention times. The Department may alter detention time requirements.

 (3 24 22)()
 - g. Controls for sludge withdrawal which minimize water losses shall must be provided.

 (3.24.22)(
- h. Unless otherwise approved by the Department based on documentation provided by the design engineer, weirs shall must be adjustable and at least equivalent in length to the perimeter of the tank. Weir loading shall must not exceed ten (10) gallons per minute per foot of weir length for units used as clarifiers or twenty (20) gallons per minute per foot of weir length for units used as clarifiers or twenty (20) gallons per minute per foot of weir length for units used for softening. Where orifices are used, the loading rates per foot of launder rates shall must be equivalent to weir loadings. Either shall must produce uniform rising rates over the entire area of the tank.
- i. Upflow rates shall must not exceed one (1) gallon per minute per square foot of area at the sludge separation line for units used as clarifiers or one and three-quarters (1.75) gallons per minute per foot of area at the slurry separation line for units used as softeners. The Department may consider higher rates if supporting data is provided.

 (3.24-22)(_____)
- **110. Settler Units**. Settler units consisting of variously shaped tubes or plates installed in multiple layers and at an angle to the flow may be used for sedimentation following flocculation. ()
- a. Inlets and outlets shall must be designed to maintain velocities suitable for settling in the basin and to minimize short-circuiting. Plate units shall must be designed to minimize unequal distribution across the units.
- **b.** Drain piping from the settler units must be sized to facilitate a quick flush of the settler units and to prevent flooding other portions of the plant.
- **c.** Although most units will be located within a plant, outdoor installations must provide sufficient freeboard above the top of settlers to prevent freezing in the units.
- **d.** Water-<u>shall must</u> be applied to tube settlers at a maximum rate of two (2) gallons per minute per square foot of cross-sectional area for tube settlers, unless higher rates are justified through pilot plant or in-plant demonstration studies. See in accordance with Subsection 501.19 for general information on conducting pilot studies.

523. FACILITY AND DESIGN STANDARDS: SURFACE WATER TREATMENT: SLOW SAND FILTRATION.

The use of these slow sand filters shall requires prior engineering studies to demonstrate the adequacy and suitability of this method of filtration for the specific water supply. Slow Sand Filtration and Diatomaceous Earth Filtration for Small Water Systems, Manual on of Design for Slow Sand Filtration, and Slow Sand Filtration, and Recommended Operations and Optimization Goals, Slow Sand Filtration referenced in Subsection 002.02, may be used as guidance in design and operation of slow sand filtration facilities.

- **Quality of Raw Water**. Slow rate gravity filtration—shall_must be limited to waters having maximum turbidities of ten (10) nephelometric units and maximum color of fifteen (15) units; such turbidity must not be attributable to colloidal clay. Raw water quality data must include examinations for algae. For source water having variable turbidity, the potential use of a roughing filter or other pretreatment technology should must be evaluated. The Department may allow the use of a pretreatment technology on raw waters that exceed the normal limits for turbidity and color, if it can demonstrated to the Department's satisfaction that pretreatment will enable slow sand filtration to properly operate and comply with these Rules.
- **Number of Units.** A minimum of two (2) units for redundancy-shall must be provided for filtration such that plant design capacity can be maintained with any component out of service for maintenance or repairs. The Department may allow a single bed filter if it can be demonstrated to the Department's satisfaction that an alternative water source is available such that the water system PWS can provide plant design capacity with the filter taken out of service for maintenance and repairs.

 (3 24 22)(____)
- **O3.** Structural Details and Hydraulics. Slow rate gravity filters—shall must be—se designed—as to provide a cover, unless otherwise approved by the Department—based on documentation provided by the design engineer, headroom to permit normal movement by operating personnel for scraping and sand removal operations, adequate access hatches and access ports for handling of sand and for ventilation, filtration to waste, an overflow at the maximum filter water level, and protection from freezing. A permanent means of determining sand depth—shall must be provided.

 (3-24-22)(_____)
- **04. Underdrains**. Each filter unit-shall <u>must</u> be equipped with a main drain and an adequate number of lateral underdrains to collect the filtered water. The underdrains-shall <u>must</u> be so spaced that the maximum velocity of the water flow in the underdrain will not exceed three-fourths (0.75) feet per second. The maximum spacing of laterals <u>shall not exceed is</u> three (3) feet if pipe laterals are used.

 (3 24 22)(_____)
 - **05. Filter Material.** The following requirements apply:
 - a. A minimum depth of thirty (30) inches of filter sand shall must be placed on graded gravel layers.
- **b.** The effective size-shall <u>must</u> be between fifteen hundredths (0.15) of a millimeter and thirty-five hundredths (0.35) of a millimeter. Larger sizes may be considered by the Department based on the results of a pilot study. See <u>in accordance with</u> Subsection 501.19-for general information on conducting pilot studies.
 - (3-24-22)(____)
 - c. The uniformity coefficient-shall must not exceed three point zero (3.0). (3.24.22)(
 - **d.** The sand shall must be cleaned and washed free from foreign matter. (3-24-22)(
- e. The sand-shall must be rebedded to the original minimum depth of thirty (30) inches when scraping has reduced the bed depth to no less than twenty-four (24) inches. Where sand is to be reused in order to provide biological seeding and shortening of the ripening process, rebedding-shall must utilize a "throw over" technique whereby new sand is placed on the support gravel and existing sand is replaced on top of the new sand. The maximum filtration rate—shall must not exceed zero point one (0.1) gallon per minute per square foot for each individual bed.

 (3 24 22)(

06. Filter Sand Support.

- ()
- **a.** A three (3)-inch layer of sand—shall—must be used as a supporting media for filter sand. The supporting sand—shall—must have an effective size of zero point eight (0.8) millimeters to two point zero (2.0) millimeters and a uniformity coefficient not greater than one point seven (1.7).
- **b.** Gravel-shall must consist of cleaned and washed, hard, durable, rounded rock particles and shall may not include flat or elongated particles. The coarsest gravel-shall must be two and one-half (2.5) inches in size when the gravel rests directly on a lateral system and must extend above the top of the perforated laterals. Not less than four (4) layers of gravel-shall may be provided in accordance with the size and depth distribution specified in the table below. Reduction of gravel depths and other size gradations may be considered upon justification to the Department.

Size of Gravel	Depth
2 1/2 to 1 1/2 inches	5 to 8 inches
1 1/2 to 3/4 inches	3 to 5 inches
3/4 to 1/2 inches	3 to 5 inches
1/2 to 3/16 inches	2 to 3 inches
3/16 to 3/32 inches	2 to 3 inches

(3-24-22)(_____

- **O7. Depth of Water Over Filter Beds**. The design shall must provide a depth of at least three (3) to six (6) feet of water over the sand. Influent water shall must not scour the sand surface.
- **O8.** Control Appurtenances. Each filter shall <u>must</u> be equipped with a loss of head gauge, an orifice, Venturi meter, or other suitable means of discharge measurement installed on each filter to control the rate of filtration, and an effluent pipe designed to maintain the water level above the top of the filter sand. The effluent piping must not be directly interconnected with the other filter beds. A sample tap shall <u>must</u> be provided for each filter bed.

 (3-24-22)(______)
- **09. Ripening.** Slow sand filters must be filtered-to-waste until they are biologically mature before being put into service following construction, scraping, re-sanding, or reopening after extended shutdown. The period of filter-to-waste shall must be as follows:

 (3.24-22)(_____)
- **a.** Filters—shall must be filtered-to-waste after scraping or cleaning until the effluent turbidity falls consistently below the pre-cleaning level, unless otherwise approved by the Department—based on documentation provided by the design engineer.

 (3-24-22)(_____)
- **b.** Filters—shall must be filtered-to-waste following construction, re-sanding, or extended shutdown based on project specific protocols—that have been approved by the Department and—then incorporated into a Department approved operation and maintenance manual. These protocols may be based on factors from standard literature such as those listed in Subsection 002.02 but typically include factors such as minimum filter-to-waste time periods, bacteriological testing, and effluent turbidity. Sampling results from the filter-to-waste period—shall must be provided to the Department for review and the Department must provide authorization prior to restarting service to the public.
- 10. Supernatant Drain Required. Filter beds shall must be equipped with a supernatant drain to allow for quick removal of water standing over sand that has become impermeable because it requires scraping or rebedding.

 (3-24-22)(_____)
- 11. Filter Bed Control and Minimum Rate of Flow. Each filter bed separately and filters must be operated at a constant filtration rate with any changes made gradually. The minimum

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

rate of filtration—shall must be at least two hundredths (0.02) gallons per minute per square foot.

3-24-22)(

524. FACILITY AND DESIGN STANDARDS:—SURFACE WATER TREATMENT: DIRECT FILTRATION.

Direct filtration, as used herein, refers to the filtration of a surface water following chemical coagulation and possibly flocculation but without prior settling. The nature of the treatment process will depend upon the raw water quality. A full scale direct filtration plant-shall must not be constructed without prior pilot studies which are acceptable to the reviewing authority Department. In-plant demonstration studies are required where conventional treatment plants are converted to direct filtration. Where direct filtration is proposed, an engineering report-shall must be submitted prior to conducting pilot plant or in-plant demonstration studies. See in accordance with Subsection 501.19 for general information on conducting pilot studies.

01. Filtration Requirements.

)

- **a.** Filters shall must be rapid rate gravity filters with dual or mixed media. The final filter design-shall must be based on the pilot plant or in-plant demonstration studies, and all portions of Section 518 apply. Pressure filters or single media sand filters-shall will not be used.

 (3 24 22)(____)
- **b.** A continuous recording turbidimeter—<u>shall_must</u> be installed on each filter effluent line and on the composite filter effluent line.
- **c.** Additional continuous monitoring equipment such as particle counting or streaming current metering to assist in control of coagulant dose may be required by the reviewing authority Department.

(3-24-22)(

- **02. Siting Requirements**. The plant design and land ownership surrounding the plant shall must allow for modifications of the plant.
- **03. Redundancy**. A minimum of two (2) units—shall must be provided for filtration such that plant capacity can be maintained with any component out of service for maintenance or repairs.

525. FACILITY AND DESIGN STANDARDS: LOW PRESSURE MEMBRANE FILTRATION.

Low pressure filtration, as used herein, refers to microfiltration or ultrafiltration processes. Low pressure membrane systems can provide greater than 3-log removal of Giardia lamblia and Cryptosporidium, and ultrafiltration systems can also provide up to 2-log virus removal. The Department will determine maximum available removal credits for the specific membrane under consideration. The actual log removal credit that a low pressure membrane filtration system will receive is the lower of the values determined by the following: the removal efficiency demonstrated during challenge testing, or the maximum log removal that can be verified by direct integrity testing required during the course of normal operation. Membrane systems—shall must contain sufficient design to allow for offline direct integrity testing of all units or modules at the required interval while retaining the capability to supply maximum day demand to the water system PWS. Membrane systems—shall must have at least two (2) units unless it can be demonstrated to the satisfaction of the Department that a secondary source or treatment component can supply the required minimum plant design capacity.

01. Membrane Selection and Design Considerations.

(

)

a. Challenge Testing. Challenge testing involves seeding feed water with an organism or particulate and measuring the log reduction of the organism or particulate between the feed and filtrate. It is a one-time product-specific test event performed by an approved third party designed to demonstrate the removal ability of the membrane. Challenge testing—shall must be conducted by the third party entity in general conformance with the USEPA Membrane Filtration Guidance Manual referenced in Subsection 002.02 (Membrane Filtration Guidance Manual). The challenge test report—shall is to be submitted to the Department along with the preliminary engineering report PER for the project. The Department may accept another state's challenge test report approval.

(3-24-22)(

b. Water Quality Considerations for Design. A review of historical source water data-shall must be conducted to determine the degree of pretreatment needed if any, the feasibility of membrane filtration, and an

estimated cost of the system. At a minimum, the following parameters—shall are to be investigated: Seasonal temperature and turbidity profiles, total organic loading, occurrence of algae, microbial activity, iron, manganese, and hardness levels, and any other inorganic or physical parameters determined to be necessary by the Department. The data—shall will be used to determine anticipated fouling and scaling, backwash and cleaning cycles and regimens, acceptable trans-membrane pressure differentials, and design flux, especially during lowest anticipated water temperature.

(3-24-22)(_____)

c. Pilot Study. A pilot study-shall must be conducted for a period that-shall be is determined by the design engineer and approved by the Department. The duration-should will include the season of lowest water temperatures and the season including the highest anticipated turbidity, algal bloom, TOC, and iron/manganese event or otherwise cover four seasons of source water quality conditions. The Department may approve a shorter duration proof pilot to verify design criteria that affect the reliable production capacity of the membrane system. The Department may approve the use of a full scale pilot study where the full scale facility will act as the pilot study. The Department may also waive the pilot study requirement. Proof pilot studies, full scale pilot studies, and the waiving of the pilot study requirement will only be approved in circumstances where source water conditions and fouling characteristics are already well understood. Such source waters include but are not limited to ground-water under the influence of surface water, waters with existing membrane plants, waters where sufficient pilot test data has already been generated, and extensively used or tested membrane products where production or test data on similar waters is available (i.e., same lake, reservoir, or same reach for stream sources). In addition to the requirements in Subsection 501.19, the pilot study-shall must include:

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

)

526. -- **528.** (RESERVED)

529. FACILITY AND DESIGN STANDARDS: REQUIRED DISINFECTION OF DRINKING WATER, ULTRAVIOLET LIGHT.

- **a.** Ultraviolet (UV) light technology is a primary disinfectant typically used for Cryptosporidium, Giardia lamblia, and virus inactivation of both surface water and ground-water supplies. Reactor performance in terms of inactivation of any particular organism is a function of the delivered dose which is determined by validation testing. PWSs that are required to maintain a disinfectant residual in the distribution system must supplement UV disinfection with a chemical disinfectant.

 (3-24-22)(____)
- b. UV disinfection credit will be awarded for filtered systems PWSs and unfiltered systems PWSs if the system unfiltered PWS meets the requirements for unfiltered systems in 40 CFR 141.71. Systems PWSs will receive Cryptosporidium, Giardia lamblia, and virus treatment credits by achieving the corresponding UV dose values for the appropriate target pathogen and log reduction shown in Subsection 529.03, calculated to take into account the validation factor and reduction equivalent dose. The target pathogen and the target log inactivation-shall be is used to identify the corresponding required UV dose.
- c. For <u>water systems PWSs</u> using UV light to meet microbial treatment requirements, at least ninety-five percent (95%) of the water delivered to the public every month must be treated by UV reactors operating within validated conditions for the required UV dose.
- **d.** When reviewing proposed UV disinfection projects, the Department will use the USEPA UV Disinfection Guidance Manual for the Final Long Term 2 Enhanced Surface Water Treatment Rule referenced in Subsection 002.02 (UV Disinfection Guidance Manual) for guidance.

02. Pilot Studies and Validation.

- a. The Department may allow on-site pilot studies on a case—by—case basis in accordance with Subsection 501.19. Pilot studies are usually used to determine how much fouling occurs on site, to evaluate UV system reliability (e.g. UV sensors, UV transmittance (UVT) monitors, ballast reliability) and to provide operators experience running a UV system. They may also be used to assess lamp aging or impacts of power quality.—See Subsection 501.19 for general information on conducting pilot studies.

 (3 24 22)
- b. Validation testing determines the operating conditions and monitoring algorithms that the UV system will use to define how much UV dose is being delivered by the reactor during operation. The validated dose as determined through validation testing is compared to the required dose in the UV Dose Table (Subsection 529.03) to determine inactivation credit. The validated dose is calculated by dividing the determined reduction equivalent dose by a validation factor to account for biases and experimental uncertainty. UV light treatment reactors—shall must be validated by a third party entity approved by the Department. At a minimum, validation testing must account for the following: UV absorbance of the water; lamp fouling and aging; measurement uncertainty of on-line UV sensors; UV dose distributions arising from the velocity profiles through the reactor; failure of UV lamps and other critical system components; inlet and outlet piping configuration of the UV reactor; lamp and UV sensor locations; and other parameters required by the Department. The Department may allow alternative test microbes such as MS2 phage where the UV dose response better matches that of Cryptosporidium and Giardia lamblia to provide more accurate and efficient UV dose monitoring. Additional guidance is available in the UV Disinfection Guidance Manual, referenced in Subsection 002.02, or another validation standard as approved by the Department.
- c. Validation testing shall must be conducted on full scale testing of a reactor that conforms uniformly to the UV reactors used by the system PWS and inactivation of a test microorganism whose dose response characteristics have been quantified with a low pressure mercury vapor lamp.
- **d.** Validation testing must determine and establish validated operating conditions under which the reactor delivers the required UV dose in Subsection 529.03. Validated operating conditions include: ()

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

i.	Flow rate;	()
ii.	UV Intensity as measured by a UV sensor;	()
iii.	UV lamp operating status.	()
e.	The department may approve an alternative approach to validation testing.	()

03. UV Dose Table. The treatment credits listed in the dose table are based on UV light at a wavelength of two hundred fifty-four (254) nm as produced by a low pressure mercury vapor lamp. To receive treatment credit for other lamp types, the <u>system shall PWS must</u> demonstrate an equivalent germicidal dose through validation testing.

UV Dose Table (millijoules per square centimeter)									
Log	Cryptosporidium	Giardia lamblia	Virus						
0.5	1.6	1.5	39						
1.0	2.5	2.1	58						
1.5	3.9	3.0	79						
2.0	5.8	5.2	100						
2.5	8.5	7.7	121						
3.0	12	11	143						
3.5	15	15	163						
4.0	22	22	186						

(3-24-22)(____

- **Q4. Reactor Design.** Inlet and outlet conditions shall must ensure that UV dose delivery at the plant is equal to or exceeds that utilized during validation. At a minimum, design criteria shall need to address target pathogen(s), required log inactivation and UV dose, flow rate, UVT, and lamp aging and fouling factors. UVT and flow rate shall are to be selected to account for seasonal changes in UVT. Lamp aging and fouling factors shall must be supported by documentation or pilot study data. Recommended approaches of the UV Disinfection Guidance Manual, referenced in Subsection 002.02, shall are to be used in meeting this requirement.
- a. The reactor systems must be designed to monitor and record parameters to verify the operation within the validated operating conditions approved by the Department. The <u>system PWS</u> must be equipped with facilities to monitor and record UV intensity as measured by a UV sensor, flow rate, lamp status, UVT, and other parameters designated by the Department.

 (3-24-22)(_____)
- **b.** The ultraviolet treatment device—<u>shall_must</u> be designed to provide a UV light dose equal to or greater than that specified in the UV Dose Table for the required log reduction. The UV Disinfection Guidance Manual, referenced in Subsection 002.02, <u>shall_must</u> be utilized in evaluating the appropriate dose required for the target microbe. The reactor—<u>shall_also_will_need_to</u> deliver the target dose while operating within the validated operating conditions for that particular unit.

 (3-24-22)(____)
- c. The ultraviolet treatment assemblies-shall <u>must</u> be designed to allow for cleaning and replacement of the lamp, lamp sleeves, and sensor window or lens. (3-24-22)(____)
- **d.** All ultraviolet treatment device designs—shall must evaluate lamp fouling and aging issues and manufacturer's recommendations regarding fouling, aging, and replacement—shall will be discussed in the Operation and Maintenance Manual.

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

е.	For	in-situ	cleaning	of the	e lamp	sleeve,	the	design-	shall _	must	protect	the	potable	water	from
cleaning solutions	s.												(3-2	4 22) ()

- **f.** When off-line chemical cleaning systems are used, the UV enclosure shall must be removed from service, drained, flushed with an NSF/ANSI Standard 60 certified solution, drained, and rinsed before being placed back in service.
- g. On-line systems that use wipers or brushes may use chemical solutions provided they are NSF/ANSI Standard 60 certified.
- h. An automatic shutdown valve shall must be installed in the water supply line from the ultraviolet treatment device such that if power is not provided to the reactor or valve, the valve shall will be in the closed position.
- i. The design of the inlet and outlet piping configuration and the locations of expansions, bends, tees and valves—shall_will assure that the UV dose delivery is equal to or greater than the required UV dose. Approach length prior to each reactor included in the credited dose calculations, downstream length following each reactor, and locations of any cleaning device/mechanism—shall_must be based on validation testing.

 (3-24-22)(_____)
- **j.** For parallel trains, the flow to each reactor—shall must be equally distributed and metered or otherwise account for uneven flows in the design to ensure that the required UV dose is delivered to each train under varying flow conditions.

 (3-24-22)(_____)
 - **k.** Valves <u>shall must</u> be provided to allow isolating and removing from service each UV reactor. (3-24-22)
- l. Reactors—shall_will be provided with air relief and pressure control valves per manufacturer requirements.
- m. UVT analyzers shall must be provided if UVT is part of the dose monitoring strategy. It is recommended that UVT be monitored on a regular basis for all systems PWSs to assess UVT variability.
- n. A single train with a standby reactor or a sufficient number of parallel ultraviolet treatment devices shall must be installed to ensure that adequate disinfection is provided when one unit is out of service. The Department may approve an alternate method that provides adequate disinfection such as standby chlorination. Any system PWS that produces water on an irregular schedule may provide documentation for the Department's review and approval that a single reactor would be is an acceptable design by demonstrating there would be is adequate for time for maintenance and cleaning during operation shutdowns.

 (3-24-22)(_____)
- **o.** No bypass of the ultraviolet treatment process may be installed unless an alternate method of providing adequate disinfection is provided.
 - 05. Controls. ()
- a. A delay mechanism—shall must be installed to provide sufficient lamp warm-up prior to allowing water to flow from the ultraviolet treatment unit.
- **b.** An automatic shutdown-shall <u>must</u> be designed to activate the shutdown valve in cases where the ultraviolet light dose falls below the approved design dose or outside of the validated specifications.

(3-24-22)(_____

- **Reliability**. The <u>system PWS</u> must be capable of producing the plant design capacity at all times.
- **a.** Standby equipment. Unless otherwise approved by the Department based on documentation provided by the design engineer and in accordance with Subsection 529.04.n., a minimum of two (2) reactors is

required to maintain disinfection when one unit is taken out of service. Each reactor must be sized to deliver the

iv.	Air filters:	()
(1) compressors and	Air filters—shall_will be provided on the suction side of the air compressors, the dryers and between the dryers and the ozone generators.	between the air

(2) The filter before the desiccant dryers—shall_will be of the coalescing type and be capable or removing aerosol and particulates larger than 0.3 microns in diameter. The filter after the desiccant dryer—shall_will be of the particulate type and be capable of removing all particulates greater than 0.1 microns in diameter, or smaller is specified by the generator manufacturer. (3-24-22)(
v. Piping in the air preparation system can be common grade steel, seamless copper, stainless steel o galvanized steel. The piping must be designed to withstand the maximum pressures in the air preparation system.
b. The following requirements apply to the ozone generator:
i. Capacity. (
(1) The production rating of the ozone generators-shall <u>must</u> be stated in pounds per day and kWhr per pound at a maximum cooling water temperature and maximum ozone concentration. (3-24-22)(
(2) The design-shall_will ensure that the minimum concentration of ozone in the generator exit gas will not be less than one (1) percent (by weight). (3-24-22)(
(3) Generators-shall_will be sized to have sufficient reserve capacity so that the system PWS does no operate at peak capacity for extended periods of time resulting in premature breakdown of the dielectrics. (3-24-22)(
(4) The production rate of ozone generators will decrease as the temperature of the coolant increases. I there is to be a variation in the supply temperature of the coolant throughout the year, then pertinent data-shall will be used to determine production changes due to the temperature change of the supplied coolant. The design-shall will ensure that the generators can produce the required ozone at maximum coolant temperature. (3-24-22)(
(5) Appropriate ozone generator backup equipment must be provided. (
ii. Electrical. The generators can be low, medium or high frequency type. Specifications—shall will require that the transformers, electronic circuitry and other electrical hardware be proven, high quality component designed for ozone service.
iii. Cooling. Adequate cooling-shall must be provided. The cooling water must be properly treated to minimize corrosion, scaling and microbiological fouling of the water side of the tubes. Where cooling water is treated, cross connection control-shall must be provided to prevent contamination of the potable water supply. (3 24 22)(
iv. Materials. To prevent corrosion, the ozone generator shell and tubes shall must be constructed o Type 316L stainless steel.
c. The following requirements apply to ozone contactors:
i. Bubble diffusers. (
(1) Where disinfection is the primary application, a minimum of two (2) contact chambers, each equipped with baffles to prevent short circuiting and induce countercurrent flow, shall will be provided. Ozone shall must be applied using porous-tube or dome diffusers.
(2) The minimum contact time—shall will be ten (10) minutes. A shorter contact time (CT) may be approved by the Department if justified by appropriate design and "CT" considerations.
(3) Where taste and odor control is of concern, multiple application points and contactors-shall will be considered. (3-24-22)(
(4) Contactors shall will be separate closed vessels that have no common walls with adjacent rooms

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

The contactor must be kept under negative pressure and sufficient ozone monitors—shall_will be provided to protect worker safety.

- (5) Contact vessels can be made of reinforced concrete, stainless steel, fiberglass or other material which will be stable in the presence of residual ozone and ozone in the gas phase above the water level. If contact vessels are made of reinforced concrete, all reinforcement bars—shall_must_ be covered with a minimum of one and one-half (1.5) inches of concrete.

 (3-24-22)(______)
- (6) Where necessary, a system shall is to be provided between the contactor and the off-gas destruct unit to remove froth from the air and return the other to the contactor or other location acceptable to the reviewing authority Department. If foaming is expected to be excessive, then a potable water spray system shall must be placed in the contactor head space.
- (7) All openings into the contactor for pipe connections, hatchways, etc. shall must be properly sealed using welds or ozone resistant gaskets such as Teflon or Hypalon.
- (8) Multiple sampling ports-shall_must be provided to enable sampling of each compartment's effluent water and to confirm "CT" calculations.
- (9) A pressure/vacuum relief valve-shall must be provided in the contactor and piped to a location where there will be no damage to the destruction unit.
- (10) The depth of water in bubble diffuser contactors shall must be a minimum of eighteen (18) feet. The contactor shall must also have a minimum of three (3) feet of freeboard to allow for foaming. (3-24-22)(
- (11) All contactors shall will have provisions for cleaning, maintenance and drainage of the contactor. Each contactor compartment shall must also be equipped with an access hatchway. (3-24-22)(______)
 - (12) Aeration diffusers shall must be fully serviceable by either cleaning or replacement.

 (3-24-22)(
- ii. Other contactors, such as the venturi or aspirating turbine mixer contactor, may be approved by the Department provided adequate ozone transfer is achieved and the required contact times and residuals can be met and verified.
 - **d.** The following requirements apply to ozone destruction units: ()
- i. A system for treating the final off-gas from each contactor must be provided in order to meet safety and air quality standards. Acceptable systems include thermal destruction and thermal/catalytic destruction units.
 - ii. The maximum allowable ozone concentration in the discharge is 0.1 ppm (by volume).
 - iii. At least two (2) units shall be provided which are each capable of handling the entire gas flow.
- iv. Exhaust blowers—shall must be provided in order to draw off-gas from the contactor into the destruct unit.
 - v. Catalysts must be protected from froth, moisture and other impurities which may harm the catalyst.
- vi. The catalyst and heating elements—shall will be located where they can easily be reached for maintenance. (3-24-22)(_____)
- **e.** Piping materials: Only low carbon 304L and 316L stainless steels—shall may be used for ozone service with 316L preferred.

)

Piping—shall will be designed to minimize or contain chemical spills in the event of pipe ruptures.

(3-24-22)(_____)

- ix. Where chemical feed is necessary for the protection of the supply, a means to assure continuity of chemical supply while servicing a bulk liquid storage tank shall be provided. (3-24-22)
- k. Day tanks are subject to the requirements in Subsections 531.02.k.i. through 531.02.k.iv. will be provided where bulk storage of liquid chemical is provided. However, upon approval by the Department, chemicals may be fed directly from shipping containers no larger than fifty-five (55) gallons. For the purposes of Section 531, day tanks are defined as liquid chemical tanks holding no more than a thirty (30) hour chemical supply.

(3-24-22)(

- i. Day tanks shall be provided where bulk storage of liquid chemicals are provided. The Department may allow chemicals to be fed directly from shipping containers no larger than fifty-five (55) gallons are subject to the requirements in Subsections 531.02.j.i. through 531.02.j.vii. except shipping containers do not require overflow pipe and drains.
- ii. Day tanks shall meet all the requirements of Subsection 531.02.j., with the exception of Subsection 531.02.j. will. Shipping containers do not require overflow pipes or drains as required by Subsection 531.02.j. and are not subject to the requirements of Subsection 531.02.j. viii. (3-24-22)
- iii. Where feasible, secondary containment—shall will be provided so that chemicals from equipment failure, spillage, or accidental drainage of day tanks—shall will be fully contained. A common receiving basin may be provided for each group of compatible chemicals. The common receiving basin—shall will provide a secondary containment volume sufficient to hold the volume of the largest storage tank. If secondary containment is not feasible, day tanks—shall will be located and protective curbings provided so that chemicals from equipment failure, spillage, or accidental drainage of day tanks—shall will not enter the water in conduits, treatment, or storage basins. Secondary containment is not required for a day tank if an Idaho licensed professional engineer demonstrates to the Department that the chemical concentration and volume, if spilled, will not be a safety hazard to employees, will not be hazardous to the public health, and will not harm the environment.

 (3-24-22)(_____)
- iviii. Day tanks and the tank refilling line entry points shall will be clearly labeled with the name of the chemical contained.
 - iv. Filling of day tanks may not be automated unless otherwise approved by the Department. (____)
 - Provisions shall must be made for measuring quantities of chemicals used to prepare feed solutions. $\frac{(3-24-22)}{(3-24-22)}$
- **m.** Vents from feeders, storage facilities and equipment exhaust-shall must discharge to the outside atmosphere above grade and remote from air intakes. (3-24-22)(_____)
- **03.** Chemicals. Chemical shipping containers shall must be fully labeled to include chemical name, purity and concentration, supplier name and address, and evidence of ANSI/NSF certification where applicable.

 $\frac{(3-24-22)}{(}$

)

- 04. Safety Requirements for Chemical Facilities. (
- **a.** The following requirements apply to chlorine gas feed and storage rooms: ()
- i. Each storage room-shall will be enclosed and separated from other operating areas. They-shall will be constructed in such a manner that all openings between the chlorine room and the remainder of the plant are sealed, and provided with doors equipped with panic hardware, assuring ready means of exit and opening outward

	b.	Where acids and caustics are used, they-shall must be kept in c	losed corrosion-resistant shipping

c. Sodium chlorite for chlorine dioxide generation. Proposals for the storage and use of sodium chlorite—shall must be approved by the Department prior to the preparation of final plans and specifications. Provisions—shall must be made for proper storage and handling of sodium chlorite to eliminate any danger of fire or explosion associated with its oxidizing nature.

containers or storage units. Acids and caustics-shall may not be handled in open vessels, but-shall will be pumped in undiluted form from original containers through suitable hose to the point of treatment or to a covered day tank.

(3-24-22)(

- i. Chlorite (sodium chlorite)-shall will be stored by itself in a separate room. It must be stored away from organic materials. The storage structure-shall will be constructed of noncombustible materials. If the storage structure must be located in an area where a fire may occur, water must be available to keep the sodium chlorite area cool enough to prevent heat-induced explosive decomposition of the chlorite.

 (3 24 22)(_____)
- ii. Care shall will be taken to prevent spillage. An emergency plan of operation shall will be available for the clean up of any spillage. Storage drums shall will be thoroughly flushed prior to recycling or disposal.

(3-24-22)(

- d. Where ammonium hydroxide is used, an exhaust fan shall must be installed to withdraw air from high points in the room and makeup air shall must be allowed to enter at a low point. The feed pump, regulators, and lines shall must be fitted with pressure relief vents discharging outside the building away from any air intake and with water purge lines leading back to the headspace of the bulk storage tank.
- **e.** Where anhydrous ammonia is used, the storage and feed systems (including heaters where required) shall <u>must</u> be enclosed and separated from other work areas and constructed of corrosion resistant materials.
 - i. Pressurized ammonia feed lines-shall will be restricted to the ammonia room. (3 24 22)(
- ii. An emergency air exhaust system, as described in Subsection 531.04.a., but with an elevated intake, shall must be provided in the ammonia storage room.
 - iii. Leak detection systems shall must be fitted in all areas through which ammonia is piped.
- iv. Special vacuum breaker/regulator provisions must be made to avoid potentially violent results of backflow of water into cylinders or storage tanks.
- v. Consideration shall must be given to the provision of an emergency gas scrubber capable of absorbing the entire contents of the largest ammonia storage unit whenever there is a risk to the public as a result of potential ammonia leaks.
- **05. Operator Safety**. The Idaho General Safety and Health Standards, referenced in Subsection 002.02, may be used as guidance in designing facilities to ensure the safety of operators. The following requirements are in addition to the requirements of Subsection 501.12. Facilities must meet applicable regulations from the Occupational Health and Safety Administration. (3-24-22)(_____)
- **a.** Respiratory protection equipment, meeting the requirements of the National Institute for Occupational Safety and Health (NIOSH) shall be available where chlorine gas is handled, and shall be stored at a convenient heated location, but not inside any room where chlorine is used or stored. The units shall use compressed air, have at least a thirty (30) minute capacity, and be compatible with or exactly the same as units used by the fire department responsible for the plant.

 (3 24 22)
- b. Chlorine leak detection. A bottle of concentrated ammonium hydroxide (fifty-six (56) per cent ammonia solution) shall be available for chlorine leak detection. Where ton containers are used, a leak repair kit approved by the Chlorine Institute shall be provided.

 (3-24-22)
 - e. Protective equipment. (3 24 22)
- i. At least one pair of rubber gloves, a dust respirator of a type certified by NIOSH for toxic dusts, an apron or other protective clothing, and goggles or face mask shall be provided for each operator. (3 24 22)
- ii. A deluge shower and eyewashing device shall be installed where strong acids and alkalis are used or stored. A water holding tank that will allow water to come to room temperature shall be installed in the water line feeding the deluge shower and eyewashing device. Other methods of water tempering will be considered on an

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

individual basis. For chemicals other than strong acids and alkalis, an appropriate eye washing device or station shall be provided. Other protective equipment shall be provided as necessary. iv. **Design Requirements for Specific Applications.** In addition to Subsection 531.01 through 531.03, the following design requirements apply for the specific applications within Subsection 531.06 of this rule. Sodium chlorite for chlorine dioxide generation. Positive displacement feeders-shall will be provided for sodium chlorite used for chlorine dioxide generation. Tubing for conveying sodium chlorite or chlorine dioxide solutions shall must be Type 1 PVC, polyethylene or materials recommended by the manufacturer. Chemical feeders may be installed in chlorine rooms if sufficient space is provided. Otherwise, facilities meeting the requirements of chlorine rooms shall will be provided. Feed lines shall will be installed in a manner to prevent formation of gas pockets and shall will terminate at a point of positive pressure. Check valves shall will be provided to prevent the backflow of chlorine into the sodium chlorite line. Hypochlorite facilities-shall must meet the following requirements: b. Hypochlorite shall will be stored in the original shipping containers or in hypochlorite compatible i. containers. Storage containers or tanks shall will be sited out of the sunlight in a cool and ventilated area. Stored hypochlorite—shall will be pumped undiluted to the point of addition. Where dilution is ii. unavoidable, deionized or softened water shall will be used unless otherwise approved by the Department. Storage areas, tanks, and pipe work-shall will be designed to avoid the possibility of uncontrolled iii. discharges and a sufficient amount of appropriately selected spill absorbent shall will be stored on-site. Hypochlorite feeders shall will be positive displacement pumps with compatible materials for iv. wetted surfaces. (3 24 22)(To avoid air locking in smaller installations, small diameter suction lines shall will be used with foot valves and degassing pump heads. In larger installations flooded suction-shall will be used with pipe work arranged to ease escape of gas bubbles. Calibration tubes or mass flow monitors which allow for direct physical checking of actual feed rates shall will be fitted. Injectors-shall will be made removable for regular cleaning where hard water is to be treated. vi. When ammonium sulfate is used, the tank and dosing equipment contact surfaces-shall must be made of corrosion resistant non-metallic materials. Provision-shall will be made for removal of the agitator after dissolving the solid. The tank shall will be fitted with a lid and vented outdoors. Injection of the solution should will take place in the center of treated water flow at a location where there is high velocity movement. (3-24-22)(When aqua ammonia (ammonium hydroxide) is used, the feed pumps and storage-shall will be

chlorinator rooms with the following changes:

prevent accidental addition of other chemicals to the storage tank.

enclosed and separated from other operating areas. The aqua ammonia room shall will be equipped as required for

an inert liquid trap to a high point outside and an incompatible connector, or lockout provisions shall will be made to

A corrosion resistant, closed, unpressurized tank shall will be used for bulk storage, vented through

- hardness. Totalizing meters must be installed on the bypass line and on each softener unit. The bypass line must have a shutoff valve. When the applied water contains a chlorine residual, the cation exchange resin-shall must be a type that is not damaged by residual chlorine. Smooth-nose sampling taps must be provided for the collection of representative samples. The taps shall will be located to provide for sampling of the softener influent, effluent, blended water, and on the brine tank discharge piping. The sampling taps for the blended water-shall will be at least twenty (20) feet downstream from the point of blending. Petcocks are not acceptable as sampling taps. i. Brine and salt storage tanks shall must meet the following requirements: i. Salt dissolving or brine tanks and wet salt storage tanks must be covered and must be corrosionresistant. The make-up water inlet must be protected from back-siphonage. ii.) Wet salt storage basins must be equipped with manholes or hatchways for access and for direct dumping of salt from truck or railcar. Openings must be provided with raised curbs and watertight covers having overlapping edges similar to those required for finished water reservoirs. Overflows, where provided, must be protected with twenty-four (24) mesh or similar noncorrodible screens, and must terminate with either a turned downed bend having a proper free fall discharge or a selfclosing flap valve. The salt shall will be supported on graduated layers of gravel placed over a brine collection system. Alternative designs which are conducive to frequent cleaning of the wet salt storage tank may be vi. considered. An eductor may be used to transfer brine from the brine tank to the softeners. If a pump is used, a brine measuring tank or means of metering shall will be provided to obtain the proper dilution. Suitable disposal must be provided for brine waste; see Section 540. Where the volume of spent brine must be reduced, consideration may be given to using a part of the spent liquid concentrate for a subsequent regeneration. Pipes and contact materials must be resistant to the aggressiveness of salt. Plastic and red brass are acceptable piping materials. Steel and concrete must be coated with a non-leaching protective coating which is compatible with salt and brine.
- FACILITY AND DESIGN STANDARDS: DESIGN STANDARDS FOR TASTE AND ODOR CONTROL.

Bagged salt and dry bulk salt storage-shall will be enclosed and separated from other operating

Provision-shall must be made for the control of taste and odor. Chemicals-shall must be added sufficiently ahead of other treatment processes to assure adequate contact time for an effective and economical use of the chemicals. Where severe taste and odor problems are encountered, in-plant studies, pilot plant studies, or both in-plant and pilot plant studies may be required. See in accordance with Subsection 501.19 for general information on conducting pilot (3 24 22)studies.

Chlorination. When using chlorination as a method of taste and odor control adequate contact time must be provided to complete the chemical reactions involved.

- **O3. Split Treatment**. Raw water may be blended with lime-softened water to partially stabilize the water prior to secondary clarification and filtration. Treatment plants designed to utilize split treatment—shall must also contain facilities for further stabilization by other methods.

 (3-24-22)(_____)
- **04.** Water Unstable Due to Biochemical Action in Distribution System. Unstable water resulting from the bacterial decomposition of organic matter in water (especially in dead end mains), the biochemical action within tubercles, and the reduction of sulfates to sulfides shall must be prevented by the maintenance of a free or combined chlorine residual throughout the distribution system.

 (3-24-22)(_____)

538. – 539. (RESERVED)

540. FACILITY AND DESIGN STANDARDS: DESIGN STANDARDS FOR TREATMENT AND DISPOSAL OF TREATMENT PLANT WASTE RESIDUALS.

Provisions must be made for PWS owners must provide proper disposal of water treatment plant waste such as sanitary, laboratory, clarification sludge, softening sludge, iron sludge, filter backwash water, and liquid concentrates. In locating waste disposal facilities, due consideration—shall_must be given to preventing potential contamination of the water supply.

(3-24-22)(______)

O1. Sanitary Waste. The sanitary waste from water treatment plants, pumping stations, and other waterworks installations must receive treatment. Waste from these facilities—shall must be discharged directly to a sanitary sewer system, when available and feasible, or to an adequate on-site waste treatment facility approved under the provisions of IDAPA 58.01.03, "Individual/Subsurface Sewage Disposal Rules." (3 24 22)()

02. Liquid Concentrates.

- ()
- **a.** Waste from ion exchange plants, demineralization plants, reverse osmosis, on-site chlorine generators, red water filters, or other plants which produce liquid concentrates may be disposed of by the following methods:

 (3 24 22)()
- i. Liquid concentrates that contain radionuclides must be further treated to remove the radioactive constituents as sludge. See Subsection 540.03.e. for disposal requirements for sludge that contains radionuclides. The residual liquids from which radionuclides have been removed may be disposed of in accordance with Subsections 540.02.a.ii. through 540.02.a.iv.
- ii. Controlled discharge to a stream or other receiving water body if adequate dilution is available. Such discharge will require a National Pollution Elimination System Permit from the U.S. Environmental Protection Agency, Region 10, 1200 Sixth Avenue, Seattle, WA 98101, Telephone (206) 553-1200. a surface water discharge permit has been issued by the applicable permitting authority and limits and conditions of discharge permit can be reasonably met.
- iii. Liquid concentrates may be discharged to a sanitary sewer, if available and feasible. Acceptance of such waste must be approved by the sewer authority.
- iv. Subsurface disposal,—of land application—of, or total containment lagoons may be considered for liquid concentrate when in compliance with IDAPA 58.01.16, "Wastewater Rules." Untreated liquid concentrates may not be permitted, but only if such discharge meets the requirements of for subsurface or land application unless otherwise approved by the Department and in accordance with IDAPA 58.01.03, "Individual/Subsurface Sewage Disposal Rules" for subsurface disposal or the requirements of IDAPA 58.01.17, "Recycled Water Rules" for land application.

 (3 24 22)(_____)
- **b.** ShouldIf the nature of the liquid concentrate causes it to be ineligible for permitted discharge as described in Subsection 540.02.a., further onsite treatment of the liquid concentrate may be required in order to produce sludge and liquid waste that will meet the permit criteria for one (1) or more of the disposal options.
 - c. If sand filters are used to treat the waste filter wash water, red water, from iron and manganese

e .	Red Water. Red water is the waste filter wash water from iron and manganese removal plants (3-7)	s. 24-22)
i.	If sand filters are used they shall have the following features: (3-3)	24-22)
(1)	Total filter area shall be sufficient to adequately dewater applied solids. Unless the filter is	-small

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

enough to be cleaned and returned to service in one (1) day, two (2) or more cells are required. (3-24-22

- (2) The "red water" filter shall have sufficient capacity to contain, above the level of the sand, the entire volume of wash water produced by washing all of the production filters in the plant, unless the production filters are washed on a rotating schedule and the flow through the production filters is regulated by true rate of flow controllers. Then sufficient volume shall be provided to properly dispose of the wash water involved.

 (3-24-22)
- Where freezing is a problem, provisions should be made for covering the filters during the winter months.
 - (4) "Red water" filters shall not have common walls with finished water. (3 24 22)
- ii. Subsurface infiltration lagoons may be permitted, but only if such discharge meets the requirements of IDAPA 58.01.03, "Individual/Subsurface Sewage Disposal Rules."

 (3. 24. 22)
- iii. "Red water" may be discharged to a sanitary sewer if available and feasible. Acceptance of such waste must be approved by the sewer authority. Design shall prevent cross connections and there shall be no common walls between potable and non-potable fluid.

 (3-24-22)
 - dc. Filter Backwash Water Sludge. (3.24
- i. Recycling is permitted if the backwash waters are returned to the head of the treatment plant or another entry point if supported by engineering studies. Backwash water-shall_will be held for a sufficient time prior to recycling to allow solids to settle out.
- ii. Dewatered sludge from backwash water clarification processes may be disposed of in a sanitary landfill in accordance with the requirements of IDAPA 58.01.06, "Solid Waste Management Rules." Acceptance of such waste must be approved by the landfill authority.
- ed. Radioactive Sludge. Waste residuals containing radioactive substances, including, but not limited to granular activated carbon used for radon removal or ion-exchange regeneration waste from uranium removal, must be disposed of in accordance with IDAPA 58.01.10, "Rules Regulating the Disposal of Radioactive Materials Not Regulated Under The Atomic Energy Act of 1954, As Amended."
- i. The buildup of radioactive materials such as uranium or radon and its decay products-shall <u>must</u> be considered and adequate shielding and safeguards shall be provided for operators and visitors. (3-24-22)(
- ii. Waste residuals containing naturally occurring radioactive materials that have been concentrated by human activities must be disposed of in an approved hazardous waste landfill (Class D), in accordance with the IDAPA 58.01.10, "Rules Regulating the Disposal of Radioactive Materials not Regulated Under the Atomic Energy Act of 1954, as Amended," and IDAPA 58.01.06, "Solid Waste Management Rules."
- iii. Waste residuals containing greater than point zero five (.05) percent by weight of uranium are subject to licensing and disposal under the regulations of the U.S. Nuclear Regulatory Commission, Region IV, 611 Ryan Plaza Drive, Suite 400, Arlington, TX 76011, Phone 817-860-8299.
- Arsenic Sludge. Solid waste residuals containing arsenic at a concentration less than five (5) mg/l may be disposed of at a sanitary landfill if permitted under IDAPA 58.01.06, "Solid Waste Management Rules." Solid waste containing arsenic at a concentration greater than five (5) mg/l must be disposed of at an approved hazardous waste landfill. Liquid wastes generated by arsenic treatment processes are subject to the handling and disposal requirements for liquid concentrates, as discussed under Subsection 540.02.
- **O4. Spent Media**. Exhausted ion exchange media, adsorption media, disposable filters, and other components of treatment processes that contain concentrated contaminants-shall must be disposed of in accordance with IDAPA 58.01.06, "Solid Waste Management Rules,"-and/or IDAPA 58.01.10, "Rules Regulating the Disposal of Radioactive Materials not Regulated Under the Atomic Energy Act of 1954, as Amended."

 (3 24 22)(_____)

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

541.	FACILITY AND DESIGN STANDARDS: PUMPING FACILITIES	
541.	FACTOR TO THE PROPERTY OF THE	_

Pumping facilities shall must be designed to maintain the sanitary quality of pumped water. (3 24 22)

- **O1.** Pump Houses. Unless otherwise approved by the Department based on documentation provided by the design engineer, pump house components shall must be located above-grade. The following requirements apply to pump houses as defined in Section 003 unless it can be shown that some or all of these requirements are not needed to protect the combination of system components in a given structure:
- **a.** Pump houses—<u>shall must</u> be readily accessible for operation, maintenance, and repair at all times and under all weather conditions unless permitted to be out of service for a period of inaccessibility.

(3 24 22)(_____

- **b.** Pump houses—<u>shall must</u> be protected from flooding and <u>shall must</u> be adequately drained. The ground surface—<u>shall will</u> be graded so as to lead surface drainage away from the pump house. Unless otherwise approved by the Department—<u>based on documentation provided by the design engineer</u>, the floor surface—<u>shall will</u> be at least six (6) inches above the final ground surface and pump house components—<u>shall will</u> be located at least six (6) inches above the floor surface.

 (3 24 22)(
- c. Pump houses—shall must be of durable construction, fire and weather resistant, and with outward-opening doors. All underground structures—shall must be waterproofed.

 (3 24 22)(_____)
- **d.** Provisions shall <u>must</u> be made for adequate heating for the comfort of the operator and the safe and efficient operation of the equipment. In pump houses not occupied by personnel, only enough heat need be provided to prevent freezing of equipment or treatment processes.

 (3-24-22)
- **e.** Ventilation-shall <u>must</u> conform to existing local <u>and/</u>or state codes. Adequate ventilation-shall <u>will</u> be provided for all pumping stations for operator comfort and dissipation of excess heat and moisture from the equipment. In all cases, measures must be taken to minimize corrosion of metallic and electrical components.

(3 24 22)()

- Pump houses shall must be provided with a locking door or access to prohibit unauthorized entrance and shall must be protected to prevent vandalism and entrance by animals. Plans and specifications for pump houses must provide enough detail to enable the reviewing engineer Department to determine that the facility is secure, safe, accessible, and that it conforms to electrical and plumbing codes.
- g. Pump houses shall must be kept clean and in good repair and shall may not be used to store toxic or hazardous materials other than those materials required for treatment processes.
- h. A suitable outlet-shall <u>must</u> be provided for drainage from pump glands without discharging onto the floor.
- i. Floor drains-shall may not be connected to sewers, storm drains, chlorination room drains, or any other source of contamination unless otherwise approved by the Department-based on documentation provided by the design engineer. Gas chlorination room drains-shall may not be connected to any other drainage system and-should must terminate in a properly located below ground sump. Sumps for pump house floor drains-shall may not be closer than thirty (30) feet from any well.

 (3-24-22)(_____)
- **j.** Adequate space shall must be provided for the installation of potential additional units and for the safe and efficient servicing of all equipment.
- **k.** Suction basins-shall must be watertight, have floors sloped to permit removal of water and settled solids, be covered or otherwise protected against contamination, and have two (2) pumping compartments or other means to allow the suction basin to be taken out of service for inspection maintenance or repair. (3 24 22)()
- l. Pump houses—<u>shall must</u> be designed to allow efficient equipment servicing. Crain-ways, hoist beams, eyebolts, or other adequate facilities for servicing or removal of pumps, motors or other heavy equipment <u>shall will</u> be provided. Openings in floors, roofs or wherever else—<u>shall must</u> be provided as needed for removal of

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

heavy or bulky equipment.

(3-24-22)(_____

- **m.** All remote controlled stations—shall <u>must</u> be electrically operated and controlled and—shall have signaling apparatus of proven performance. Signaling apparatus—shall <u>must</u> report automatically when the station is out of service.

 (3 24 22)(
- ${f n.}$ Any threaded hose bib installed in the pump house must be equipped with an appropriate backflow prevention device.
- **Pumping Units.** At least two (2) pumping units-shall must be provided for raw water and surface source pumps. Pumps using seals containing mercury-shall may not be used in public drinking water system PWS facilities. With any pump out of service, the remaining pump or pumps-shall must be capable of providing the peak hour demand of the system PWS or a minimum of the maximum day demand plus equalization storage. See Subsection 501.18 for general design requirements concerning fire flow capacity and Subsection 501.07 regarding reliability and emergency operation. The pumping units shall must meet the following requirements:

(3-24-22)(

- a. The pumps shall have ample capacity to supply the maximum demand against the required pressure without dangerous overloading.

 (3-24-22)(____)
- b. The pumps-shall be are driven by prime movers able to meet the maximum horsepower condition of the pumps. (3-24-22)(____)
 - c. The pumps shall be are provided with readily available spare parts and tools. (3-24-22)(
- **d.** The pumps—<u>shall are to</u> be served by control equipment that has proper heater and overload protection for air temperature encountered.
- **e.** Suction lift shall be is avoided if possible. When suction lift is used, it shall must be within the limits allowed by the manufacturer of the pumps, and provision shall will be made for priming the pumps.

(3.24.22)(

- **f.** Prime water must not be of lesser sanitary quality than that of the water being pumped. Means-shall will be provided to prevent either backpressure or backsiphonage backflow. When an air-operated ejector is used, the twenty-four (24) mesh or similar non-corrodible screened intake-shall will draw clean air from a point at least ten (10) feet above the ground or other source of possible contamination, unless the air is filtered by an apparatus approved by the reviewing authority Department. Vacuum priming may be used.

 (3-24-22)(______)
- **03. Appurtenances.** The following appurtenances <u>shall must</u> be provided for all water pumps. Additional requirements specific to well pumps are provided in Section 511. (3-24-22)(
- a. Pumps—shall_must be protected against freezing and valved to permit satisfactory operation, maintenance, and repair of the equipment. If foot valves are necessary, they shall must have a net valve area of at least two and one-half (2.5) times the area of the suction pipe and they shall be screened. Each pump—shall_must have an accessible check valve on the discharge side between the pump and the shut-off valve or a combination valve that performs both control valve and check valve functions. Surge relief measures—shall_must be designed to minimize hydraulic transients.

 (3 24 22)(_____)
- b. In general, piping shall be designed so that it will have watertight joints, be protected against surge or water hammer, be provided with suitable restraints where necessary, be designed so that friction losses will be minimized, and not be subject to contamination. Piping must be designed with watertight joints, friction losses minimized, protection against surge or water hammer, suitable restraints, and not be subject to contamination.

(3-24-22)(____

<u>c.</u> Each pump <u>shall must</u> have an individual suction line or <u>the manifolded</u> suction lines <u>shall be manifolded</u> such that they will ensure similar hydraulic and operating conditions.

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

<u>ed</u> .	Each pump station-shall must have a stand	lard pressure gauge on	its discharge line	and suction	line.
				(3.24.22)()

- Water seals shall may not be supplied with water of a lesser sanitary quality than that of the water being pumped. Where pumps are sealed with potable water and are pumping water of lesser sanitary quality, the seal shall must:
- i. Be provided with either an approved reduced pressure principle backflow preventer or a break tank open to atmospheric pressure,
- ii. Where a break tank is provided, have an air gap of at least six (6) inches or two (2) pipe diameters, whichever is greater, between the feeder line and the flood rim of the tank.
- ef. Pumps, their prime movers, and accessories shall must be controlled in such a manner that they will operate at rated capacity without dangerous overload. Where two (2) or more pumps are installed, provision—shall must be made for alternation. Provision—shall must be made to prevent energizing the motor in the event of a backspin cycle. Equipment—shall will be provided or other arrangements made to prevent surge pressures from activating controls which switch on pumps or activate other equipment outside the normal design cycle of operation.

 $\frac{(3-24-22)}{(}$

- **04. Booster Pumps**. In addition to other applicable requirements in Section 541, booster pumps must comply with the following:
- a. In-line booster pumps—shall must maintain an operating pressure that is consistent with the requirements specified in Subsection 552.01, and—shall be supplied with an automatic cutoff when intake pressure is less than or equal to five (5) psi.

 (3.24.22)(_____)
- **b.** Booster pumps with a suction line directly connected to any storage reservoirs—<u>shall must</u> be protected by an automatic cutoff to prevent pump damage and avoid excessive reservoir drawdown.

(3.24.22)(

c. Each booster pumping station—shall_must contain not less than two (2) pumps with capacities such that peak hour demand, or a minimum of the maximum day demand plus equalization storage, can be satisfied with any pump out of service. See Subsection 501.18 for general design requirements concerning fire flow capacity.

(3 24 22)(

542. FACILITY AND DESIGN STANDARDS—DISTRIBUTION SYSTEM.

- **01. Protection from Contamination**. The distribution system—<u>shall must</u> be protected from contamination and be designed to prevent contamination by steam condensate or cooling water from engine jackets or other heat exchange devices.

 (3 24 22)(____)
- **02. Installation of Water Mains**. Division 400 of "Idaho Standards for Public Works Construction," referenced in Subsection 002.02, may be used as guidance for installation of water mains. In addition, the following provisions shall apply:
- **a.** Installed pipe-shall must be pressure tested and leakage tested in accordance with the applicable AWWA Standards, incorporated by reference into these rules at Subsection 002.01. (3-24-22)(______)
- **b.** New, cleaned, and repaired water mains <u>shall must</u> be disinfected in accordance with AWWA Standard C651, incorporated by reference into these rules at Subsection 002.01. The specifications <u>shall must</u> include detailed procedures for the adequate flushing, disinfection, and microbiological testing of all water mains.

(3 24 22)(____

c. In areas where aggressive soil conditions are suspected or known to exist, analyses shall must be performed to determine the actual aggressiveness of the soil. If soils are found to be aggressive, action shall must be taken to protect metallic joint restraints and the water main, such as encasement in polyethylene, provision of

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

cathodic protection, or use of corrosion resistant materials.

3-24-22)(____

- d. The Department must approve any interconnection between potable water supplies sources, taking into account differences in water quality between the two systems.
- e. A continuous and uniform bedding shall must be provided in the trench for all buried pipe. Backfill material shall must be tamped in layers around the pipe and to a sufficient height above the pipe to adequately support and protect the pipe. Stones found in the trench-shall must be removed for a depth of at least six (6) inches below the bottom of the pipe.

 (3-24-22)(_____)
 - f. Water mains shall must be covered with sufficient earth or other insulation to prevent freezing.

 (3-24-22)
- **g.** All tees, bends, plugs and hydrants-shall must be provided with reaction blocking, tie rods or joints designed to prevent movement. (3-24-22)(_____)
- **03. Pressure Relief Valves.** All pumps connected directly to the distribution system—shall must be designed in conjunction with a water pressure relief valve of type, size, and material approved by the Department unless the Department approves another method that will prevent excessive pressure development. (3-24-22)(_____)
- **05. Pipe and Jointing Materials.** Pipe and jointing materials comply with the standards set forth in Subsection 501.01. Pipe shall must be manufactured of materials resistant internally and externally to corrosion and not imparting tastes, odors, color, or any contaminant into the system PWS. Where distribution systems are installed in areas of ground-water contaminated by organic compounds:

 (3 24 22)(____)
- a. Pipe and joint materials which do not allow permeation of the organic compounds shall must be used; and (3.24.22)()
- **b.** Non-permeable materials—<u>shall must</u> be used for all portions of the <u>system PWS</u> including pipe, joint materials, hydrant leads, and service connections.
- **O6. Size of Water Mains.** When fire hydrants are provided, they-shall may not be connected to water mains smaller than six (6) inches in diameter, and fire hydrants-shall may not be installed unless fire flow volumes are available. If fire flow is not provided, water mains-shall will be no less than three (3) inches in diameter. Any departure from-this these minimum standards-shall must be supported by hydraulic analysis and detailed projections of water use.
- a. Alternative separation distances may be considered for Subsections 542.07.b through 542.07.c. on a case-by-case basis when considering constructability, public health risk, environmental risk, and cost. The design engineer must submit data to the Department for review and approval showing that the proposed installation will be protective of public health and the environment.

12. Meter Vault Required. All new <u>public water systems shall PWSs. and undergoing material modification, must</u> include a meter vault at each service connection. A lo shall <u>must</u> be installed in the meter vault. This requirement shall also apply to extensions of the existing public water systems.	ockable shut-off valve
13. Minimum Pressure at Building Sites. Any public water system PWS cons material modification where topographical relief may affect water pressure at the customers provide the Department with an analysis which demonstrates that the pressure at each designate at least forty (40) psi, based on dynamic pressure in the main, as set forth in Subsections 552.0 plus a static compensation from the elevation of the main to the elevation of each building site.	' premises shall mused building site will be

that reasonable effort be made to provide notification to existing and potential customers of the expected pressure.

If forty (40) psi cannot be provided at each designated building site, the Department may require

()

- **b.** The Department will not authorize a service connection at any designated building site where analysis indicates that pressure will be less than twenty (20) psi-statie_dynamic pressure (or twenty-six point five (26.5) psi for two (2) story buildings).
- **14. Isolation Valves.** A sufficient number of valves shall must be provided on water mains to minimize inconvenience and sanitary hazards during repairs.
- 15. Air Valves. At high points in water mains where air can accumulate, provisions shall must be made to remove the air by means of air release and vacuum relief valves or combination air release/vacuum relief valves. Air release valves, vacuum relief valves, or combination air release/vacuum relief valves may not be required if vacuum relief and air release functions in the pipeline can be adequately handled by approved appurtenances such as fire hydrants.
- a. The open end of an air valve—shall_must be extended to at least one (1) foot above grade and provided with a twenty-four (24) mesh or similar non-corrodible screened, downward-facing elbow. When the air vent on an air relief valve cannot be practically installed above ground, the vent may be below grade provided-that the valve is manually operated and the air vent is extended to the top of the valve vault and provided with a twenty-four (24) mesh or similar non-corrodible screened, downward-facing elbow. In addition, for below ground vents, the valve vault must be rated for appropriate traffic loading in traffic areas and the vault drained to daylight or provided with adequate drainage to prevent flooding of the vault.

 (3-24-22)(_____)
- **b.** Discharge piping from air valves or combination air release/vacuum relief valves—shall may not connect directly to any storm drain, storm sewer, or sanitary sewer.
- 17. Surface Water Crossings. For the purposes of Subsection 542.17, surface water is defined as all surface accumulations of water, natural or artificial, public or private, or parts thereof which are wholly or partially within, which flow through or border upon the state. This includes, but is not limited to, rivers, streams, canals, ditches, lakes, and ponds. Surface water crossings, whether over or under water, shall must be constructed as follows:

 (3-24-22)(
- a. Above water crossings: the pipe shall Pipe used in above water crossings must be adequately supported and anchored, protected from damage and freezing, and shall be accessible for repair or replacement.

 (3 24 22)()
- **b.** Under water crossings: APipe used in under water crossings must have a minimum cover of two (2) feet shall be provided over the pipe. When crossing a water course that is greater than fifteen (15) feet in width, the following shall must be provided:

 (3-24-22)
- i. The pipe-shall_will be of special construction, having flexible, restrained, or welded water-tight joints; and
- ii. Valves shall are to be provided at both ends of water crossings so that the section can be isolated for testing or repair; the valves shall will be easily accessible and not subject to flooding; and (3-24-22)(_____)
- iii. Permanent taps or other provisions to allow insertion of a small meter to determine leakage and obtain water samples shall will be made on each side of the valve closest to the supply source. (3-24-22)(_____)

543. FACILITY AND DESIGN STANDARDS: CROSS CONNECTION CONTROL.

There-shall must be no connection between the distribution system and any pipes, pumps, hydrants, water loading stations, or tanks whereby unsafe water or other contaminating materials may be discharged or drawn into a PWS.public water system. The water purveyor is responsible through its cross connection control program to take reasonable and prudent measures to protect the water system against contamination and pollution from cross

connections through premises isolation or containment, internal or in-plant isolation, fixture protection, or some combination of premises isolation, internal isolation, and fixture protection. Community PWS owners must meet the cross connection control program requirements in Subsection 552.06.

- **O1. Testable Assemblies**. All double check valve backflow prevention assemblies, reduced pressure principle backflow prevention assemblies, spill resistant vacuum breakers, and pressure vacuum breakers used must pass a performance test conducted by the University of Southern California Foundation for Cross-Connection Control and Hydraulic Research (USC Foundation) and be included on the USC Foundation "List of Approved Assemblies."
- **02. Atmospheric Vacuum Breakers**. All atmospheric vacuum breakers used shall must be marked approved either by the International Association of Plumbing and Mechanical Officials (IAPMO) or by the American Society of Sanitation Engineers (ASSE).
- **Replacement Parts and Components**. All replacement parts and components, including resilient seated shutoff valves, shall must meet original manufacturer's specifications or otherwise be approved by the USC Foundation as replacement parts or components for use on double check valve backflow prevention assemblies, reduced pressure principle backflow prevention assemblies, pressure vacuum breakers, and spill resistant pressure vacuum breakers. The design, material, or operational characteristics of any assembly must not be altered during maintenance or repair.

 (3 24 22)()
- **O4. Assembly Selection**. Appropriate and adequate backflow prevention assembly types for various facilities, fixtures, equipment, and uses of water-should must be selected from the AWWA Pacific Northwest Section Cross Connection Control Manual, the Uniform Plumbing Code, the AWWA Recommended Practice for Backflow Prevention and Cross Connection Control (M14), the USC Foundation Manual of Cross Connection Control, or other sources deemed acceptable by the Department. The selected assembly manufacturer model number must be included on the USC Foundation "List of Approved Assemblies" and must comply with local ordinances. (3-24-22)(______)
- 544. FACILITY AND DESIGN STANDARDS: GENERAL DESIGN OF FINISHED WATER STORAGE. The materials and designs used for finished water storage structures shall must provide stability and durability as well as protect the quality of the stored water. Finished water storage structures shall must be designed to maintain water circulation and prevent water stagnation. Steel structures and facilities such as steel tanks, standpipes, reservoirs, and elevated tanks shall must be designed and constructed in accordance with applicable AWWA Standards, incorporated by reference into these rules at Subsection 002.01. Other materials of construction are acceptable when properly designed to meet the requirements of Section 544.

01. Sizing and Isolation Requirements. ()

- **a.** Storage facilities shall must have sufficient capacity, as determined from engineering studies that consider peak flows, fire flow capacity, and analysis of the need for various components of finished storage as defined under the term "Components of Finished Water Storage" in Section 003. The requirement for storage may be reduced when the source and treatment facilities have sufficient capacity with standby power to supply peak demands of the system PWS.
- **b.** All storage structures which provide pressure directly to the distribution system, such as elevated storage structures or ground level storage structures with associated pumping systems, shall must be designed so they can be isolated and drained for cleaning or maintenance without causing a loss of pressure in the distribution system.

 (3-24-22)
- **02. Location.** Storage facilities shall must be located in a manner that protects against contamination, ensures structural stability, protects against flooding, and provides year-round access by vehicles and equipment needed for repair and maintenance.
- a. If the bottom elevation of a storage reservoir must be below normal ground surface, it-shall must be placed above the seasonal high ground-water table. The top of a partially buried storage structure may not be less than two (2) feet above normal ground surface.

 (3 24 22)()

- b. Non-potable mains and services, standing water, and similar sources of possible contamination must be kept at least fifty (50) feet from any partially buried or below ground storage structure or facility, except that non-potable mains and services constructed of potable water class pipe are allowed as close as twenty (20) feet from a partially buried or below ground storage structure or facility. Partially buried or below ground storage structures or facilities shall be located a minimum of fifty (50) feet from the nearest property line. Minimum separation distances from storage facilities must meet the following requirements:

 (3-24-22)(____)
- e. No public water supply storage tank shall be located within five hundred (500) feet of any municipal or industrial wastewater treatment plant or any land which is spray irrigated with wastewater or used for sludge disposal.

 (3-24-22)
- d. The top of a partially buried storage structure shall not be less than two (2) feet above normal ground surface.
- **e.** Ground-level or above-ground storage structures or facilities shall be located a minimum of twenty (20) feet from the nearest property line and a minimum of twenty (20) feet from any potential source of contamination.

Minimum Separation Distances From Storage Facilities (feet)					
Feature of Concern	Storage Facility Type				
	Below Ground	Partially Buried	Ground Level	Above Ground	
Non-Potable Pipelines	<u>50</u>	<u>50</u>			
Non-Potable Pipelines Constructed of Water Class Pipe	<u>20</u>	<u>20</u>			
Standing Water	<u>50</u>	<u>50</u>	<u>50</u>		
Possible Sources of Contamination	<u>50</u>	<u>50</u>	<u>20</u>	<u>20</u>	
Nearest Property Line	<u>50</u>	<u>50</u>	<u>20</u>	<u>20</u>	
Municipal or Industrial Wastewater Treatment Plant	<u>500</u>	<u>500</u>	<u>500</u>	<u>500</u>	
Land Which is Spray Irrigated With Wastewater or Used for Sludge Disposal	<u>500</u>	<u>500</u>	<u>500</u>	<u>500</u>	

(3 24 22)(

- **O3. Protection from Contamination.** All finished water storage structures—shall_must have suitable watertight roofs which exclude birds, animals, insects, and excessive dust. The installation of appurtenances, such as antennas, shall must be done in a manner that ensures no damage to the tank, coatings or water quality, or corrects any damage that occurred.

 (3-24-22)(_____)
- **Protection from Trespassers**. Fencing, locks on access manholes, and other necessary precautions shall must be provided to prevent trespassing, vandalism, and sabotage.

 (3-24-22)(____)
- **05. Drains**. No drain on a water storage structure may have a direct connection to a sewer or storm drain. The design-shall must allow draining the storage facility for cleaning or maintenance without causing loss of pressure in the distribution system.

 (3 24 22)(_____)

06.	Overflow. Overflow pipes of any storage structure or facility shall must discharge to daylight in a
	ude the possibility of backflow to the reservoir and, where practical, be provided with an expanded
metal screen instal	led within the pipe that will exclude rodents and deter vandalism. The overflow pipe shall must be
of sufficient diame	ter to permit waste of water in excess of the filling rate and be designed to mitigate blockage or
freezing (see Subse	ection 544.11). The overflow-shall must discharge over a drainage inlet structure or a splash plate
and, when practica	l, discharge at an elevation between twelve (12) and twenty-four (24) inches above the receiving
surface.	(3 24 22)(

- **a.** When an internal overflow pipe is used on above-ground tanks, it shall must be located in the access tube.
- **b.** The overflow for ground-level, partially buried, or below-ground storage structures or facilities shall must have a vertical section of pipe at least two (2) pipe diameters in length and-either: (3-24-22)
- ## B_be screened with a twenty-four (24) mesh non-corrodible screen installed within the pipe when practical or an expanded metal screen installed within the pipe plus a weighted flapper valve or check; or unless otherwise approved by the Department.

 (3-24-22)(_____)
 - ii. Be an equivalent system acceptable to the Department.
- **07.** Access. Finished water storage structures shall must be designed with reasonably convenient access to the interior for cleaning and maintenance. At least two (2) manholes shall will be provided above the waterline at each water compartment where space permits, as determined by the Department. One (1) manhole may be allowed on smaller tanks on a case-by-case basis.
- **a.** The following access requirements apply to above-ground and ground-level storage structures. Each access manhole-shall must be framed a minimum of four (4) inches above the surface of the roof at the opening. The actual height above the surface of the roof must be sufficient to prevent incidental contamination from snow accumulation, storm water runoff or accumulation, irrigation water, or other potential sources of contamination.

d storage structures

- **b.** The following access requirements apply to, partially buried or below-ground storage structures. Each access manhole-shall must be elevated a minimum of twenty-four (24) inches above the surface of the roof or the ground level, whichever is higher. The actual height above the surface of the roof or the ground level must be sufficient to prevent incidental contamination from snow accumulation, storm water runoff or accumulation, irrigation water, or other potential sources of contamination.

 (3-24-22)
- c. Each manhole shall must be fitted with a solid water tight cover designed to prevent the entrance of contaminants. Each cover shall may be hinged only on one (1) side and shall have a locking device. Unless otherwise approved by the Department based on documentation provided by the design engineer, each cover shall will have a framed opening with the lid extending down around the frame at least two (2) inches, and the frame shall will be at least four (4) inches high.
- **08. Vents**. Finished water storage structures <u>shall must</u> be vented. The overflow pipe <u>shall may</u> not be considered a vent. Open construction between the sidewall and roof is not permissible. Vents <u>shall must</u>:

a. Prevent the entrance of surface water and rainwater and extend twelve (12) inches above the roof.

b. Exclude birds and animals. ()

- c. Exclude insects and dust, as much as this function can be made compatible with effective venting and be designed to mitigate blockage or freezing (see Subsection 544.11).
 - **d.** On ground-level, partially buried, or below-ground structures, open downward with the opening at

least twenty-four (24) inches above the roof or the ground level and covered with twenty-four (24) mesh non-corrodible screen or similar non-corrodible screen. The screen-shall is to be installed within the pipe at a location least susceptible to vandalism.

(3-24-22)(_____)

- **e.** On above-ground tanks and standpipes, open downward, and be fitted with twenty-four (24) mesh or similar non-corrodible screen. (3-24-22)
- **Roof and Sidewall**. The roof and sidewalls of all water storage structures must be watertight with no openings except properly constructed vents, manholes, overflows, risers, drains, pump mountings, control ports, or piping for inflow and outflow. Particular attention—shall is to be given to the sealing of roof structures which are not integral to the tank body.

 (3 24 22)(____)
- **a.** Any pipes running through the roof or sidewall of a metal storage structure must be welded, or properly gasketed. In concrete tanks, these pipes-shall must be connected to standard wall castings which were poured in place during the forming of the concrete.

 (3-24-22)(_____)
- **b.** Openings in the roof of a storage structure designed to accommodate control apparatus or pump columns-shall <u>must</u> be curbed and sleeved with proper additional shielding to prevent contamination from surface or floor drainage.

 (3-24-22)(____)
- c. The roof of the storage structure shall <u>must</u> be sloped to facilitate drainage. Downspout pipes shall <u>may</u> not enter or pass through the reservoir. Parapets, or similar construction which <u>would</u> tends to hold water and snow on the roof, will not be approved unless adequate waterproofing and drainage are provided. (3 24 22)(______)
- **d.** Reservoirs with pre-cast concrete roof structures must be made watertight with the use of a waterproof membrane or similar product.
- 10. Construction Materials. Materials used in storage facility construction—shall must meet the requirements for water contact surfaces set forth in Subsection 501.01. Porous materials such as wood or concrete block are not acceptable for use in storage construction.
- 11. **Protection from Freezing**. Finished water storage structures and their appurtenances, especially the riser pipes, overflows, and vents, shall must be designed to prevent freezing which will interfere with proper functioning.
- 12. Internal Catwalk. Every catwalk over finished water in a storage structure-shall <u>must</u> have a solid floor with sealed raised edges, designed to prevent contamination-from shoe scrapings and dirt. (3-24-22)(_____)
- 13. Silt Stops. Removable silt stops shall must be provided to prevent sediment from entering the reservoir discharge pipe.
- **14. Grading.** The area surrounding a ground-level, partially buried, or below-ground structures—shall must be graded in a manner that will prevent surface water from standing—within fifty (50) feet of it. (3-24-22)(______)
- 15. Coatings and Cathodic Protection. Proper protection—shall_must be given to metal surfaces by paints or other protective coatings, by cathodic protective devices, or by both.
- **16. Disinfection.** Storage facilities—<u>shall must</u> be disinfected in accordance with AWWA Standard C652, incorporated by reference into these rules at Subsection 002.01. Two (2) or more successive sets of samples, taken at twenty-four (24) hour intervals, <u>shall must</u> indicate microbiologically satisfactory water before the facility is placed into operation.

 (3-24-22)(_____)
- **17. Abandonment**. All unused subsurface storage tanks—shall must be removed and backfilled, or abandoned by extracting residual fluids and filling the structure with sand or fine gravel. (3-24-22)(_____)
- **545. FACILITY AND DESIGN STANDARDS: TREATMENT PLANT STORAGE FACILITIES.** The design standards of Section 544-shall apply to treatment plant storage. (3-24-22)

- **01. Filter Wash Water**. Filter wash water tanks—shall must be sized, in conjunction with available pump units and finished water storage, to provide the backwash water required by Section 521. Consideration must be given to the backwashing of several filters in rapid succession.

 (3-24-22)(____)
- **O2.** Clearwell. When finished water storage is used to provide disinfectant contact time special attention must be given to tank size and baffling. An overflow and vent-shall must be provided. A minimum of two (2) clearwell compartments-shall must be provided to allow for cleaning or maintenance. Clearwells constructed under filters may be exempt from the requirements set out in Subsection 544.02.d. when the design provides adequate protection from contamination.

 (3-24-22)(_____)
- **03. Adjacent Storage**. Finished or treated water must not be stored or conveyed in a compartment adjacent to untreated or partially treated water when the two (2) compartments are separated by a single wall, unless approved by the <u>reviewing authority Department</u>.

 (3.24.22)(_____)
- Other Treatment Plant Storage Tanks. Unless otherwise allowed by the reviewing authority Department, other treatment plant storage tanks/basins such as detention basins, backwash reclaim tanks, receiving basins, and pump wet-wells for finished water-shall must be designed as finished water storage structures. In addition, these tanks/basins-shall must be designed to allow for cleaning or maintenance through temporary tanks, standby pumping capabilities, or other means approved by the Department.

546. FACILITY AND DESIGN STANDARDS: DISTRIBUTION SYSTEM STORAGE FACILITIES.

- **O1. Design**. The applicable design standards of Section 544-shall be followed for apply to distribution system storage.
- **O2. Isolation**. Finished water storage structures which provide pressure directly to the distribution system—shall must be designed so they can be isolated from the distribution system and drained for cleaning or maintenance without causing a loss of pressure in the distribution system. This requirement may be met through available temporary tanks, redundant pumping capabilities, or other temporary means approved by the Department. If the finished water storage structure provides fire flow for the water system PWS, the water system PWS owner—shall must provide the local fire authority advance notification of cleaning or maintenance events which isolate the structure from the distribution system and reduce available fire flow to less than the minimum required by the local fire authority.
- **O3. Drain.** Drains—<u>shall_must</u> discharge to daylight in a way that will preclude the possibility of backflow to the reservoir and, where practical, be provided with an expanded metal screen installed within the pipe that will exclude rodents and deter vandalism. The drain—<u>shall_will</u>, when practical, discharge at an elevation between twelve (12) and twenty-four (24) inches above the receiving surface, and discharge over a drainage inlet structure or a splash plate.

 (3-24-22)(_____)
- **04. Level Controls**. Adequate controls shall must be provided to maintain levels in distribution system storage structures. Level indicating devices shall must be provided at a central location. (3-24-22)(_____)

547. FACILITY AND DESIGN STANDARDS: HYDROPNEUMATIC TANK SYSTEMS.

Hydropneumatic tanks use compressed air may be used to regulate pump cycling and to absorb pressure surges (water hammer). These tanks do not provide true storage. Systems serving more than one hundred fifty (150) homes are generally better served by providing reservoir storage, as set forth in Sections 544, 545 and 546 Hydropneumatic tanks may not be used for storage for PWSs serving more than one-hundred-fifty (150) connections unless otherwise approved by the Department.

- 01. General-Design of Hydropneumatic Systems. Tanks must:
- (3-24-22)(____
- a. Tanks shall be located above normal ground surface and be completely housed. (3-24-22)(
- **b.** Tanks shall he are bypass piping to permit operation of the system PWS while the tank is being repaired or painted. Exterior surfaces and accessible interior surfaces shall are to be provided with protective coatings

and shall be maintained in good condition. Supports beneath tanks-shall must be structurally sound. (3-24-22)(_____

- c. Tanks shall bBe sized to limit pump cycles to not more than six (6) per hour unless a pump manufacturer's warranty specifically supports more frequent cycling. The number of pump cycles may be increased in systems PWSs with multiple pumps if a means to automatically alternate pumps is provided. The Franklin Electric AIM manual, referenced in Subsection 002.02, Chapter 11 of the Washington State Department of Health Water System Design Manual, referenced in Subsection 002.02, or manufacturer's recommendations may be used as guidance in calculating the size of hydropneumatic tanks.
- d. Tanks of greater than one-hundred twenty (120) gallons volume shall eConform with the American Society of Mechanical Engineers (ASME) specifications code for unfired pressure vessels when they are of greater than one-hundred twenty (120) gallons volume. Tanks of less than one hundred twenty (120) gallons volume—shall must meet the ASME code or be certified by a nationally recognized testing agency to be capable of withstanding twice the maximum allowable working pressure.
- **Requirements Specific to Conventional Hydropneumatic Tanks**. Conventional tanks are those that have with a direct air to water interface and require periodic air recharge to compensate for absorption of air into the water.
- a. Each tank—shall <u>must</u> have an access manhole, a drain, and control equipment consisting of a pressure gauge, water sight glass, automatic or manual air blow-off, means for adding air that is filtered or otherwise protected from contamination, and pressure operated start-stop controls for the pumps. If tank size allows, the access manhole shall will be at least twenty-four (24) inches in diameter.

 (3 24 22)(_____)
- **b.** The gross volume of tanks in-systems <u>PWSs</u> served by variable speed pumps may be less than that required for <u>systems <u>PWSs</u> served by constant speed pumps. Design volumes <u>shall will</u> be approved by the Department on a site-specific basis. (3-24-22)(____)</u>
- **03. Requirements Specific to Bladder Tanks**. Bladder tanks have a membrane that separates air and water inside the tank.
- **b.** Each manifold assembly shall must have a pressure gauge and pressure operated start-stop controls for the pumps. (3-24-22)(_____)
- c. The procedure for sizing bladder tanks is to determine the number of a selected size of tanks that are needed to provide pump protection. Reduced tank volume in-systems PWSs served by variable speed pumps shall will be approved by the Department on a site-specific basis.
- 548. FACILITY AND DESIGN STANDARDS: DISINFECTION OF FACILITIES PRIOR TO USE.

Any supplier of water for a public water system shall PWS must ensure that new construction or modifications to an existing system shall be PWS are flushed and disinfected in accordance with American Water Works Association (AWWA) Standards, incorporated by reference into these rules at Subsection 002.01, prior to being placed into service.

549. -- **551.** (RESERVED)

552. OPERATING CRITERIA FOR PUBLIC WATER SYSTEMS.

- **01. Quantity and Pressure Requirements**. Design requirements regarding pressure analysis are found in Section 542.13. (3-24-22)
- a. Minimum Capacity. The minimum capacity of a public drinking water system shall PWS must be at least eight hundred (800) gallons per day per residence.

Docket No. 58-0108-2301 Proposed (Fee) Rulemaking

i.	The minimum capacity of eight hundred (800) gallons per day-	shall be is the design maximum day
demand rate excl	lusive of irrigation and fire flow requirements.	<u>(3 24 22)(</u>

- ii. The minimum capacity of eight hundred (800) gallons per day is only acceptable if the public drinking water system PWS has equalization storage of finished water in sufficient quantity to compensate for the difference between a water system's PWS's maximum pumping capacity and peak hour demand. (3-24-22)(_____)
- iii. The design capacity of a-public drinking water system PWS for material modifications may be less than eight hundred (800) gallons per day per residence if the water system PWS owner provides information that demonstrates to the Department's satisfaction the maximum day demand for the system PWS, exclusive of irrigation and fire flows, is less than eight hundred (800) gallons per day per residence.
- **b.** Pressure. All public water systems shall PWS owners must meet the following pressure requirements:
- i. Any public water system shall be capable of providing sufficient water during maximum day demand conditions, including fire flow where provided, to maintain a minimum pressure of twenty (20) psi throughout the distribution system, at ground level, as measured at the service connection or along the property line adjacent to the consumer's premises.

 (3-24-22)(____)

ii. Public Notification. (3-24-22)

- (1) During unplanned or emergency situations, when water pressure within the system is known to have fallen below twenty (20) psi, the water supplier must notify the Department, provide public notice to the affected customers within twenty-four (24) hours, and disinfect or flush the system as appropriate. When sampling and corrective procedures have been conducted and after determination by the Department that the water is safe, the water supplier may re-notify the affected customers that the water is safe for consumption. The water supplier shall notify the affected customers if the water is not safe for consumption.
- (2) During planned maintenance or repair situations, when water pressure within the system is expected to fall below twenty (20) psi, the water supplier must provide public notice to the affected customers prior to the planned maintenance or repair activity and shall ensure that the water is safe for consumption. (3 24 22)
- iii. If an initial investigation by the water supplier fails to discover the causes of inadequate or excessive pressure, the Department may require the water supplier to conduct a local pressure monitoring study to diagnose and correct pressure problems. Compliance with these requirements by water systems PWSs that do not have a meter vault or other point of access at the service connection or along the property line adjacent to the consumer's premises where pressure in the distribution system can be reliably measured shall must be determined by measurements within the consumer's premises, or at another representative location acceptable to the Department.
- iviii. Copies of pressure monitoring study reports required under Subsection 552.01.b.iii. detailing study results and any resulting corrective actions planned or performed by the public water system shall PWS owner must be submitted to the Department in accordance with these rules.
- iv. The following public water systems PWSs or service areas of public water systems shall PWSs must maintain a minimum pressure of forty (40) psi throughout the distribution system, during peak hour demand conditions, excluding fire flow, measured at the service connection or along the property line adjacent to the consumer's premises.

 - (2) Any new service areas. ()
- (3) Any public water system PWS that is undergoing material modification where it is feasible to meet the pressure requirements as part of the material modification. (3-24-22)(_____)

- vi. Any public water system shall PWS must keep static pressure within the distribution system below one hundred eighty (10080) psi and should ordinarily keep static pressure below eighty (80) psi. Pressures above one hundred eighty (10080) psi shall must be controlled by pressure reducing valve stations installed in the distribution main. In areas where failure of installed pressure reducing valve stations would result in extremely high pressure, pressure relief valves may be required. The Department may approve the use of pressure reducing devices at individual service connections on a case-by-case basis, if it can be demonstrated that higher pressures in portions of the distribution system are required for efficient system PWS operation. If system PWS modification will cause pressure to routinely exceed eighty (80) psi, or if a check valve or an individual pressure reducing device is added to the service line, the water system PWS owner shall must notify affected customers. Notification may include reasons for the elevated pressure, problems or damage that elevated pressure can inflict on appliances or plumbing systems, and suggested procedures or mitigation efforts affected property owners may initiate to minimize problems or damage.
- vii. The Department may allow the installation of booster pump systems at individual service connections on a case-_by-_case basis. However, such an installation may only occur with the full knowledge and agreement of the-<u>public water system PWS owner</u>, including assurance by the-<u>water system PWS</u> that the individual booster pump will cause no adverse effects on-<u>system PWS</u> operation.

 (3-24-22)(_____)
- viii. For elevated storage tanks, pressure calculations during peak hour demand shall be are based on the lowest water level after both operational storage and equalization storage have been exhausted. Pressure calculations during fire flow demands shall be are based on the lowest water level after operational storage, equalization storage, and fire suppression storage have been exhausted.
- ixviii. For hydropneumatic tanks, pressure calculations shall be are based on the lowest pressure of the pressure cycle and this requirement shall must be noted in the operation and maintenance manual. (3 24 22)(1)
- **c.** Fire Flows. Any public water system PWS designed to provide fire flows shall must ensure that such flows are compatible with the water demand of existing and planned fire-fighting equipment and fire fighting practices in the area served by the system PWS.
 - **d.** Irrigation Flows. ()
- i. Any—public water system_PWS constructed after November 1, 1977, shall must be capable of providing water for uncontrolled, simultaneous foreseeable irrigation demand, which—shall includes all acreage that the—system_PWS is designed to irrigate.
- (1) The Department must concur with assumptions regarding the acreage to be irrigated. In general, an assumption that no outside watering will occur is considered unsound and is unlikely to be approved.
- (2) An assumption of minimal outside watering, as in recreational subdivisions, may be acceptable if design flows are adequate for maintenance of "green zones" for protection against wildland fire.
- ii. The <u>Department may modify the</u> requirement of Subsection 552.01.d.i. may be modified by the <u>Operatment</u> if:
 - (1) A separate irrigation system is provided; or ()
- (2) The supplier of water can regulate the rate of irrigation through its police powers, and the water system PWS is designed to accommodate a regulated rate of irrigation flow. The Department may require the water system PWS to submit a legal opinion addressing the enforceability of such police powers.
- iii. If a separate non-potable irrigation system is provided for the consumers, all mains, hydrants and appurtenances shall must be easily identified as non-potable. The Department must concur with a plan to ensure that each new potable water service is not cross-connected with the irrigation system.
 - **02.** Ground-Water. (3-24-22)(____)

a.	Public water systems constructed after July 1, 1985, and PWSs supplied by ground in the system PWS by disinfection if the ground-water source is not protected from	1-water, shall r	<u>nust</u>

3-24-22)(___

- iii. Automatic proportioning chlorinators are required where the rate of flow or chlorine demand is not reasonably constant.

 (3-24-22)
- iviii. Analysis for <u>free chlorine disinfectant</u> residual <u>shall must</u> be conducted at a location at or prior to the first service connection at least daily and records of these analyses <u>shall are to</u> be kept by the supplier of water for at least one (1) year. A report of all daily chlorine residual measurements for each calendar month <u>shall must</u> be submitted to the Department no later than the tenth day of the following month. The frequency of measuring <u>free chlorine disinfectant</u> residuals <u>shall must</u> be sufficient to detect variations in <u>chlorine</u> demand or changes in water flow.
 - If gas chlorination equipment is provided, a separate and ventilated room is required. (3-24-22)
- viiv. The Department may, in its discretion, require a treatment rate higher than that specified in Subsection 552.04.a.i.
- vii. When chlorine gas is used, chlorine leak detection devices and safety equipment shall be provided and equipped with both an audible alarm and a warning light.

 (3-24-22)
- viii. The Department may require redundant chlorine pumping capabilities with automatic switchover for systems with documented source water contamination problems and that lack adequate storage to supply the system during a pump failure.

 (3 24 22)
- **b.** Systems PWSs using only ground—water that add—chlorine disinfectant for the purpose of maintaining a disinfectant residual in the distribution system, when the source(s) is not at risk of microbial contamination, are subject to the following requirements:

 (3-24-22)(____)
- i. Automatic proportioning chlorinators are required where the rate of flow or chlorine demand is not reasonably constant.

 (3-24-22)
- ii. A_analysis for free chlorine disinfectant residual-shall be made at a frequency that is sufficient to detect variations in chlorine demand or changes in water flow.
- **c.** Systems PWSs using only ground-water that add chlorine for other purposes, such as oxidation of metals or taste and odor control, when the source(s) is known to be free of microbial contamination, must ensure that chlorine residual entering the distribution system after treatment is less than four (4.0) mg/L. The requirements in Subsection 552.04.b.ii. also apply if the system PWS maintains a chlorine residual in the distribution system.

(3-24-22)(____)

05. Fluoridation.

()

a. Commercial sodium fluoride, sodium silico fluoride and hydrofluosilicic acid which conform to the applicable American Water Works Association (AWWA) Standards, incorporated by reference into these rules at Subsection 002.01, are acceptable. Use of other chemicals shall must be specifically approved by the Department.

(3-24-22)()

b. Fluoride compounds <u>shall are to</u> be stored in covered or unopened shipping containers.

(3-24-22)()

- c. Provisions shall must be made to minimize the quantity of fluoride dust. Empty bags, drums, or barrels shall are to be disposed of in a manner that will minimize exposure to fluoride dusts.
- d. Daily records of flow and amounts of fluoride added shall must be kept. An analysis for fluoride in finished water shall must be made at least weekly. Records of these analyses shall are to be kept by the supplier of water for five (5) years.

- **06.** Cross Connection Control Program Community Water Systems. The water purveyor is responsible through its cross connection control program to take reasonable and prudent measures to protect the water system PWS against contamination and pollution from cross connections through premises isolation, internal or inplant isolation, fixture protection, or some combination of premises isolation, internal isolation, and fixture protection. Pursuant to Section 543, all suppliers of water for community water systems shall PWSs must implement a cross connection control program to prevent the entrance to the system PWS of materials known to be toxic or hazardous. The water purveyor is responsible to enforce the system's PWS's cross connection control program. The program will at a minimum include:
- **a.** An inspection program to locate cross connections and determine required suitable protection. For new connections, PWS owners must install suitable protection must be installed prior to providing water service.

(3-24-22)(

- **b.** Required installation and operation of adequate backflow prevention assemblies. Appropriate and adequate backflow prevention assembly types for various facilities, fixtures, equipment, and uses of water-should must be selected from the AWWA Pacific Northwest Section Cross Connection Control Manual, the Uniform Plumbing Code, the AWWA Recommended Practice for Backflow Prevention and Cross Connection Control (M14), the USC Foundation Manual of Cross Connection Control, or other sources deemed acceptable by the Department. The assemblies must meet the requirements of Section 543 and comply with local ordinances. (3-24-22)(_____)
- c. Annual inspections and testing of all installed backflow prevention assemblies by a tester licensed by a licensing authority recognized by the Department. Testing—shall_must be done in accordance with the test procedures published by the University of Southern California Foundation for Cross-Connection Control and Hydraulic Research. See the USC Foundation Manual of Cross-Connection Control referenced in Subsection 002.02.
- **d.** Discontinuance of service to any structure, facility, or premises where suitable backflow protection has not been provided for a cross connection.
- e. Assemblies that cannot pass annual tests or those found to be defective—shall are to be repaired, replaced, or isolated within ten (10) business days. If the failed assembly cannot be repaired, replaced, or isolated within ten (10) business days, water service to the failed assembly—shall must be discontinued.

 (3 24 22)(_____)
- **07. Cross Connection Control Non-Community Water Systems.** All suppliers of water for non-community water systems shall <u>must</u> ensure that cross connections do not exist or are isolated from the potable water system by an approved backflow prevention assembly. Backflow prevention assemblies <u>shall must</u> be inspected and tested annually for functionality by an Idaho licensed tester, as specified in Subsections 552.06.c. and 552.06.e.

(3.24.22)(

)

- 08. Start-up Procedures For Seasonal Systems Subject To Subsections 100.01.a., c., and d.
- a. All seasonal system PWS owners and operators must demonstrate completion of a Department approved start-up procedure, including start-up sampling, prior to serving water to the public. The system PWS owner-or operator must submit information on a Department provided or approved form that includes a statement certifying that the system PWS owner or operator followed proper start-up procedures. The form shall must be submitted to the Department within 30 (thirty) days following the system's PWS's start-up date. Start-up sampling must include total coliform samples submitted to a certified laboratory demonstrating the absence of total coliform within thirty (30) days prior to serving water to the public.
- **b.** The Department may exempt any seasonal <u>system PWS</u> from Subsection 552.08.a. if the entire distribution system remains pressurized during the entire period that the <u>system PWS</u> is not operating, except that the <u>systems PWS</u> that monitor less frequently than monthly must still monitor during the vulnerable period designated by the Department. The Department may exempt a seasonal <u>system PWS</u> from Subsection 552.08.a. if the owner or operator of the <u>system PWS</u> meets all of the following conditions:
 - i. Requests an exemption in writing to the Department for approval;

	ii.	Demonstrates a clean compliance history as defined in Section 003 for a minimum of five (5) years.	ears;

An operator in responsible charge water system PWS must hold a valid Idaho license equal to or greater than the classification of tem PWS where the responsible charge operator is in responsible charge as defined in Section of the performance of operations or acceptance of operations or acceptance of operations of the performance of operations or acceptance of operations of the performance of operations or acceptance of operations or acceptance of operations of the performance of operations or acceptance of operations or acceptance of operations of the performance of operations or acceptance of operations or acceptance of operations of the performance of operations or acceptance of the performance of operations of the performance of operations or acceptance of the performance of operations or acceptance of the performance of operations of the performance of operations or acceptance of the performance of operations of the performa	f the <u>003</u> .

03.

Substitute Responsible Charge Operator License Requirement. At such times as the

responsible charge operator is not available, a substitute responsible charge operator shall be designated to replace the responsible charge operator. A substitute responsible charge operator of a public water system must hold a valid license equal to or greater than the classification of the public water system where the substitute responsible charge operator is in responsible charge.

(3-24-22)

- 94. Shift Operator Requirement. Any public drinking water system subject to these requirements with multiple operating shifts must have a designated properly licensed operator available for each operating shift. An on duty designated shift operator does not replace the requirements in Subsections 554.01 and 554.03 for responsible charge operator coverage during all operating shifts.

 (3-24-22)
- **O53.** Water Operator License Requirement. All operating personnel at <u>public drinking water systems</u>

 PWSs subject to these requirements making process control/ system integrity decisions about water quality or quantity that <u>can</u> affect public health must hold a valid <u>Idahoand current</u> license.

 (3-24-22)(_____)
- **Mater Operator License Upgrade Allowance.** A twelve (12) month period will be provided to meet increased drinking water distribution system operator licensure requirements when a higher licensure level is required based on a population increase if the following requirements are met:
 - <u>a.</u> The licensure increase is triggered solely by a population increase; and
- <u>b.</u> The responsible charge operator of the PWS at the time the distribution licensure requirement increases remains the responsible charge operator throughout the twelve (12) month timeframe.

555. -- 559. (RESERVED)

560. CONTRACTING FOR SERVICES.

Public water systems may PWS owners who contract with persons to provide responsible charge operators and substitute responsible charge operators-need to submit P proof of such contract shall be submitted to the Department prior to the contracted person performing any services at the public water system PWS.

561. -- 562. (RESERVED)

563. ADVISORY GROUP.

Stakeholder Involvement. Ongoing stakeholder involvement will be provided through the existing drinking water advisory committee at the Department.

PROPOSED RULE COST/BENEFIT ANALYSIS

<u>Section 67-5223(3)</u>, <u>Idaho Code</u>, requires the preparation of an economic impact statement for all proposed rules imposing or increasing fees or charges. This cost/benefit analysis, which must be filed with the proposed rule, must include the reasonably estimated costs to the agency to implement the rule and the reasonably estimated costs to be borne by citizens, or the private sector, or both.

Department or Agency: Department of Environmental Quality

Agency Contact: Tyler Fortunati Phone: 373-0140

Date: June 12, 2023

IDAPA, Chapter and Title Number, and Chapter Name:

IDAPA 58.01.08, Idaho Rules for Public Drinking Water Systems

Fee Rule Status: X Proposed Temporary

Rulemaking Docket Number: 58-0108-2301

STATEMENT OF ECONOMIC IMPACT

The fees are unchanged from the previous year.

Section 39-119, Idaho Code Community and non-transient non-community public water systems pay an annual fee according to the following fee schedule:

Number of Connections	Fee
1 to 20	\$100
21 to 184	\$5 per connection, not to exceed a total of \$735 per public water system
185 to 3,663	\$4 per connection, not to exceed a total of \$10,988 per public water system
3,664 or more	\$3 per connection

The annual fee for transient public water systems is twenty-five dollars (\$25).

Estimated Costs to the Agency to Implement the Rules in FY24*:

Rule Chapter	General Funds	Dedicated Funds	Federal Funds	Total
58.01.08	\$0	\$1,700,032	\$3,791,925	\$5,491,957

^{*}The Bureau's budget and spending authority for FY24 includes Bipartisan Infrastructure Law funding that is not typical of a normal fiscal year. The costs estimated in the table above reflect the FY24 budget line items that are necessary to implement the rules and drinking water program and exclude additional BIL funding that would not be considered part of a typical FY budget.

Overview of Incorporations by Reference for the DEQ Drinking Water Program - Docket No. 58-0108-2301 Required by Idaho Code § 67-5223(4)

Rulemaking Docket No. 58-0108-2301 describes incorporation by reference of final federal national primary drinking water regulations promulgated with effective dates through July 1, 2023.

An efficient way to implement new or updated federal regulations is to incorporate them by reference into state rule. Reproducing the Code of Federal Regulations in state rule is impractical and costly. Therefore, when possible, DEQ incorporates federal regulations by reference. Sections with no changes are also incorporated to ensure the state rules are consistent with federal regulations and to provide one set of rules for industry to follow. Idaho industry is required to comply with all applicable new and updated federal rules regardless of whether DEQ incorporates them by reference.

Incorporation by reference of federal national primary drinking water regulations is a standard procedure that DEQ performs to meet the legislative intent to avoid the existence of duplicative, overlapping, or conflicting state and federal regulatory systems and allows DEQ to maintain authority for implementing the federal Safe Drinking Water Act (SDWA) and National Primary Drinking Water Regulations program in lieu of EPA.

To maintain primacy of the SDWA and National Primary Drinking Water Regulations in effect under 40 CFR Part 141, the state of Idaho must adopt drinking water rules that are no less stringent than the National Primary Drinking Water Regulations. The federal regulations incorporated by reference in IDAPA 58.01.08, Idaho Rules for Public Drinking Water Systems, ensure that these rules meet the minimum requirements to maintain primacy and enforcement authority of the SDWA and national primary drinking water regulations without being more stringent than the federal minimum requirements.

The following table summarizes the Code of Federal Regulations sections the DEQ Drinking Water Program incorporates by reference.

40 CFR Part	Title	Changes During Past Year?	Impact on Idaho
141	National Primary Drinking Water Regulations	Yes	Yes
143	Other Safe Drinking Water Act Regulations	No	No

An overview of the changes is included below.

The following parts were revised and may have an impact on Idaho facilities:

40 CFR Parts 141.80

Subpart I – Control of Lead and Copper

In this final rule, EPA updated regulations related to the control of lead and copper. This was completed through the Lead and Copper Rule Revisions published on January 15, 2021. These changes were made to provide greater and more effective protection of public health by reducing exposure to lead and copper in drinking water. A full description and rule text can be found in the Federal Register.

The changes to the regulations will better identify high levels of lead, improve the reliability of lead tap sampling results, strengthen corrosion control treatment requirements, expand consumer awareness, and improve risk communication. The updates will also require community public water systems to conduct lead-in-drinking-water testing and public education in schools and childcare facilities. The rule will also accelerate lead service line replacements by propelling early action and strengthen replacement requirements.

These revisions to the regulations for the Control of Lead and Copper generally affect two groups: (1) All community public water systems; and (2) all non-transient non-community public water systems.
