SCIENCE

Land Managers Can't Burn the West Fast Enough

Prescribed burns, which create buffers against larger fires, can do only so much.

AMANDA MONTHEI OCTOBER 28, 2020

Huge Wildfires are often Premeditated

"If the location is right, if extreme weather is not predicted, and if the appropriate resources are on hand to help should anything go awry, allowing wildfires to burn naturally—with viable fire lines established ahead of time—could be the best way to accomplish widespread forest management."

POSITION PAPER ADVOCATES LONG-TERM USE OF APPLIED FIRE

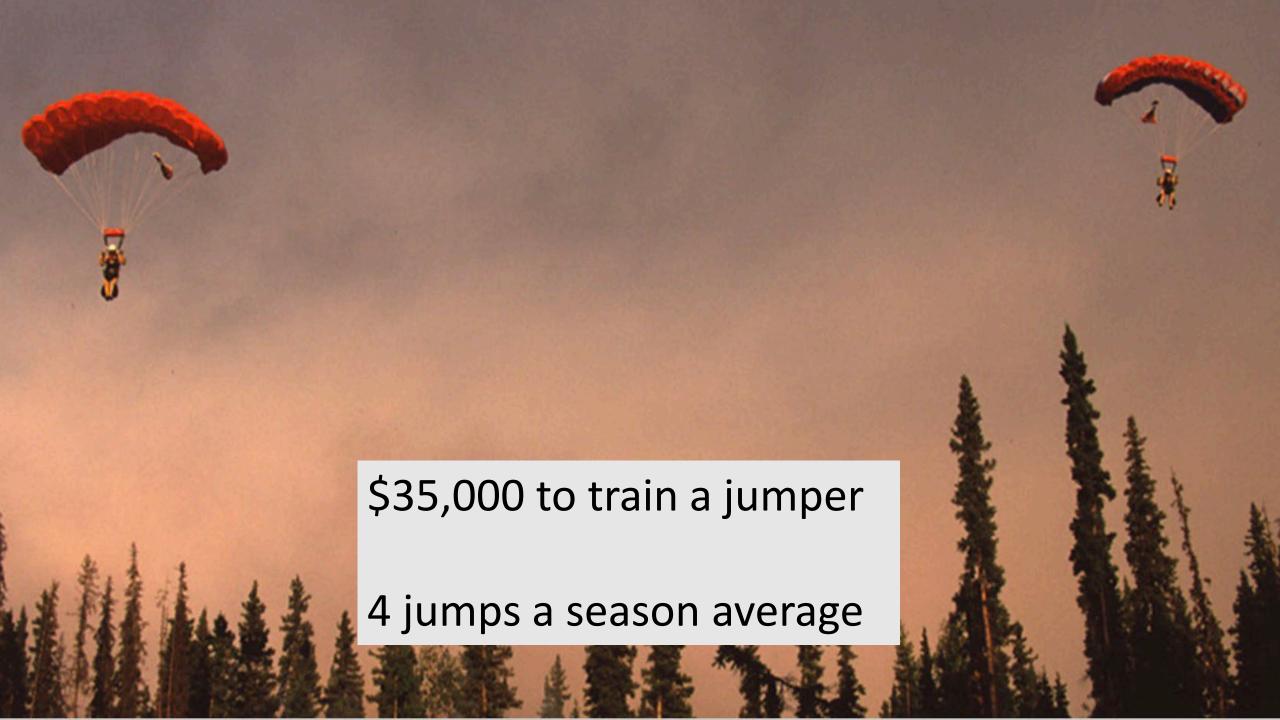

The International Association of Wildland Fire (IAWF) is an independent, non-profit organization. For more than 30 years, the IAWF has facilitated global communication on wildland fire and provided objective leadership through a neutral forum of diverse experts who consider and address all important, and at times controversial, wildland fire issues.

IAWF membership spans all continents; the association is a primary global voice of wildland fire personnel, land managers, and scientists. IAWF's goal is to tackle contemporary issues confronting wildland fire communities to achieve a sustainable wildland fire paradigm.

today. Currently, the fire is 10 acres. Smoke can be seen from Camp Geronimo, Geronimo Estates and Bray Creek Ranch but no structures are threatened at this time. Firefighters will continue to monitor the fire and contingency plans are in place should conditions change. #AZFire #TontoNF

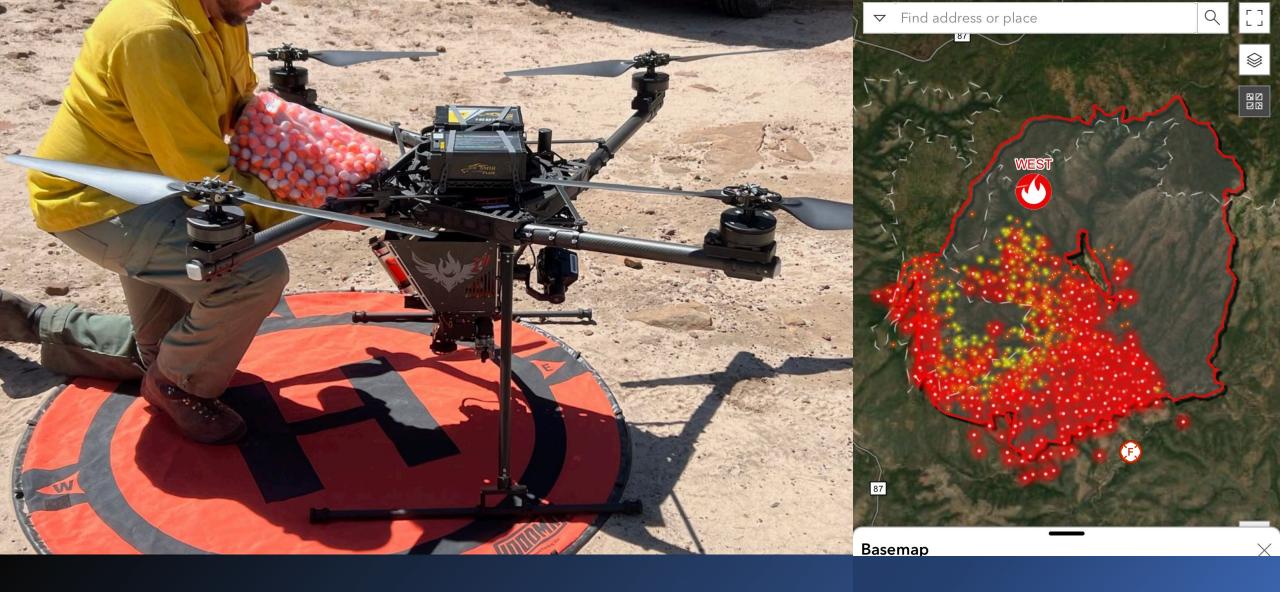

To safely and effectively extinguish fire, when needed; use fire where allowable; manage our natural resources; and as a Nation, live with wildland fire.

National Cohesive Wildland Fire Management Strategy

- 194,000 acres
- 16 Dead
- Herds dead
- Billions in Damages

Prepared by EMS August 30th, 2022

The Bear Fire killed everything 2020

Rancher Dave Daley lost several hundred cattle and his entire permitted range. Daley Photo

No compensation to private landowners damaged by wildfire use / applied wildfire

No legal basis...

- Wildfire Use and Managed fire are major federal actions that demands conformance to procedural law including NEPA/NFMA/APA and substantive laws including Clean Air, Clean Water, ARPA, T&E.
- There is no programmatic EIS or unit EISs, no Records of Decision, no public processes or objection periods.
- Fire managers are using "emergency fire suppression" money to conduct massively expensive and time-consuming "prescribed wildfires" with no specific authorization from Congress.

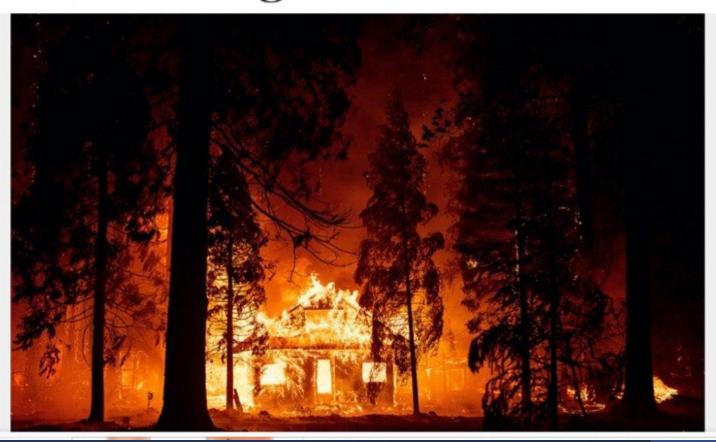

Public and private landowners are unaware of the policy until after the fire

Proprietary decisions are made to use a wildfire with no outside input and no opportunity to object or participate

California Says Federal 'Let it Burn' Policy is Reckless as Wildfires Rage Out of Control

Using Congressionally appropriated WFM "emergency fire suppression" dollars to field thousands of firefighters to do unprescribed wildfires for 8 months through the spring, summer, and fall....

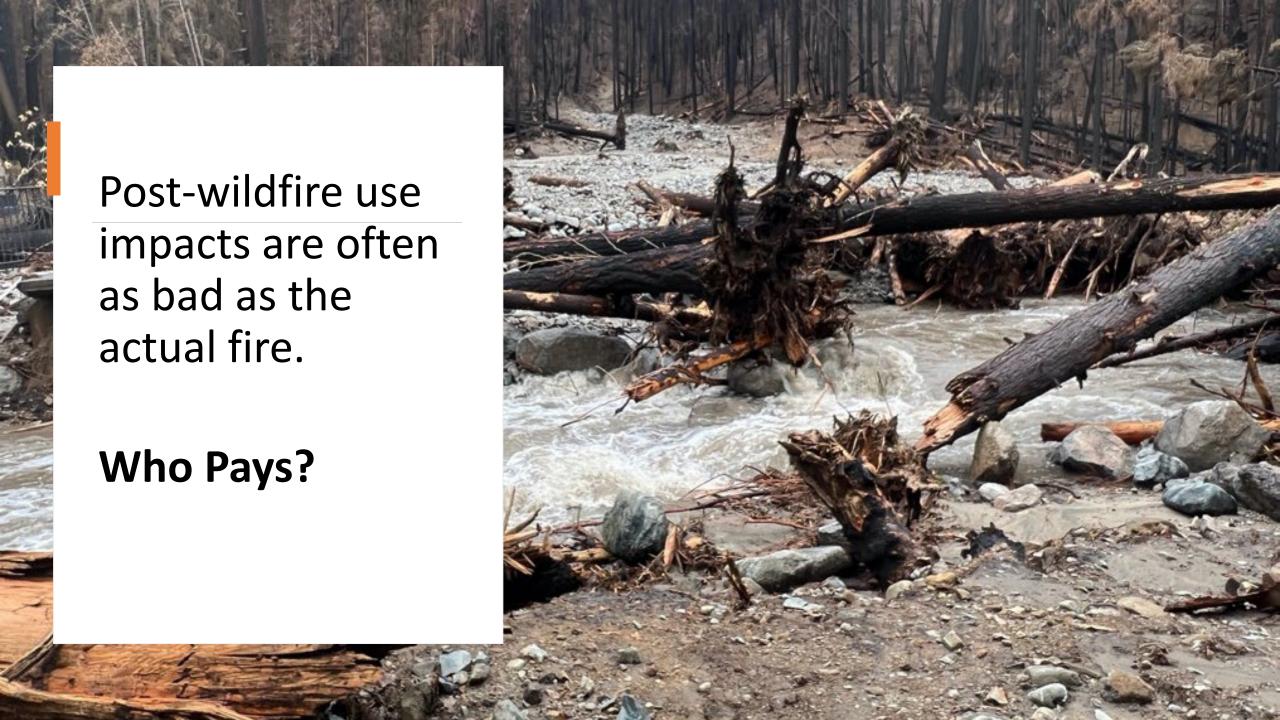

The National strategy is not National...

- Forest Service Wildfire use. No NEPA/NFMA
- National Park Service Implements only with NEPA without regard for private
- BLM Very limited use
- BIA Does not use
- States Do not use
- Private Does not use

Family of three killed in post fire flooding

Zeke Lunder

"We should...not pretend ... the Forest Service is a functional agency because it's not They can't meet our expectations of them getting anything done because they can't. They lost so much they're really not a functional agency. They can't do anything at scale, and they haven't been able to since they stopped cutting big trees They were really good at cutting big trees ..., but since then they no longer have a function. They've lost their esprit de corps and sense of purpose, and their reason for being has gone away So, they still have to manage the land with active management ...what does that leave us? Well, using fire is active forest management. So, they're using fire."

Are you ready:

Spraying a bunch of napalm on the edge of a fire scar that is too green to burn and directly adjacent to eager-to-burn natural fuels seems like it could cause some real problems going into our strong east wind season. I am glad people seem to be taking their time to figure out this part of the fire. That said, the fire they put on the ground here a few days ago is pushing to the west and will soon outflank the area they fired. So once again, the fire is going to force our hand. There is a crude saying on Hotshot crews: 'Don't crawl up the devil's asshole with a book of matches.' Meaning don't rush to light back fires when you can't hold the fire you've already got. I have been thinking of this one a lot in the past

Commentary from a Mapper

"The burn they did on West Prospect Peak was slow because the nine-year-old snow brush from the Reading Fire was too green to burn. From what I could see the other day thru the smoke when I went to Old Station, I don't think they got a clean black line, just some random stuff burning. They were talking about using a terra torch (truck-mounted napalm flame-thrower) to make it burn -hmm- if its that green maybe we should put some direct line up on the old reading fire scar and be done — but I get it, I am old school."

Commentary from an FF
